**ABSTRACT:** The genus *Euphilotes* at the northern end of its distribution is reviewed, with special emphasis on populations in Montana. Also discussed are some *Euphilotes* populations in Oregon, Washington, Idaho and southwestern Canada that have affinities with Montana. This region has until recently been essentially neglected in studies of the genus. We characterize and discuss six species (two newly described) and twenty-five subspecies (six newly described) of *Euphilotes*, including a number of yet undescribed populations. **New species** include *Euphilotes heracleoides* Kohler & A. Warren (type locality in Sanders County, Montana) and *Euphilotes oakleyi* Kohler (type locality in Missoula County, Montana). **New subspecies** include *Euphilotes baueri borealis* Kohler (type locality in Sanders County, Montana), *Euphilotes baueri shoshone* Kohler (type locality in Butte County, Idaho), *Euphilotes oakleyi madisonensis* Kohler (type locality in Madison County, Montana), *Euphilotes ancilla montosa* Kohler (type locality in Missoula County, Montana), *Euphilotes ancilla campestris* Kohler (type locality in Powder River County, Montana), and *Euphilotes rita montanensis* Kohler (type locality in Carbon County, Montana). Adults and male and female genitalia are figured for all newly described taxa, and compared to various congeners.

**Additional key words:** Biogeography, distribution, genitalia, larval food plant associations, phenology.

**ZooBank registration:** [urn:lsid:zoobank.org:pub:47038BBD-E62F-4390-A885-C491B8E99ECE](https://lsid.zoobank.org/pub:47038BBD-E62F-4390-A885-C491B8E99ECE)

## INTRODUCTION

*Euphilotes* Mattoni, [1978] blues are among the least well-known of North American butterflies. Since the original description of the genus, myriad subspecific taxa have been described, and the most recent review of the genus (Pratt & Emmel, 1998) only partially resolved species-level taxonomic issues. Much of the confusion surrounding *Euphilotes* stems from the very similar superficial appearances of several taxa. Knowledge of larval food plants, adult genitalia, and local geographical and temporal distributions are often necessary for identification. The life cycles of *Euphilotes* are closely coordinated with those of their larval food plants, which are various *Eriogonum* Michx. species (Polygonaceae), wild buckwheat. More than one taxon of *Euphilotes* may co-occur, either synchronously or not, but most co-occurring species use different food plants (Austin et al., 2008).

Kohler (1980) listed only two species of *Euphilotes* as occurring in Montana, *E. battoides glaucon* (W. H. Edwards, 1871) and *E. enoptes ancilla* (W. Barnes & McDunnough, 1918). Pratt & Emmel's (1998) revision of the *Euphilotes enoptes* and *E. battoides* complexes elevated *E. ancilla* to the species-level, but otherwise provided little information relative to Montana. This last and earlier works with a

primary focus on California and Nevada have essentially neglected the northern end of the distribution of the genus, including Oregon, Washington, Idaho, Montana and southwestern Canada. Warren (2005) presented considerable information on *Euphilotes* in Oregon, including some discussions of a few populations in other northwestern states. Pelham (2008) presented a complete synonymic list of *Euphilotes*, including all of the then known 57 described subspecies-level taxa (except *E. bernardino garthi* Mattoni, 1989, endemic to Isla de Cedros, Baja California, Mexico), arranged into thirteen species. At the time Pelham (2008) was published, several of the taxa described by Pratt & Emmel (1998) as subspecies of *E. battoides* (Behr, 1867) had not been formally aligned with species-level taxa in that complex. As a result, the arrangement of subspecific taxa under *E. battoides* in Pelham (2008) apparently represented a polyphyletic assemblage. The listing of *Euphilotes* taxa by Warren et al. (2009) followed Pelham's (2008) arrangement, except that it also indicated a number of undescribed segregates among then recognized species, included the recently described *Euphilotes stanfordorum* Opler & A. Warren, 2009, and included the Mexican endemic *E. bernardino garthi*. Pelham's (2021) revised online catalog lists 60 described subspecies-level *Euphilotes* taxa, arranged into 16 species. Color images of adults of essentially all taxa discussed herein, including a large number of primary and secondary types, are provided in Warren et al. (2016).

Males of most *Euphilotes* taxa may travel a considerable distance from their larval food plants in search of mud, where they sometimes congregate in large numbers. In such situations, determining the identities of these males in the absence of larval food plant information can be difficult. Rarely, females also visit mud. Without prior detailed knowledge of what *Euphilotes* segregates in the different species groups occur in any given area, *Euphilotes* adults found at mud sometimes cannot be reliably identified in the field, even when voucher specimens are sampled (Warren 2005). We have used caution in applying and citing information gleaned from the literature on *Euphilotes* taxa due to confusion between similar species, the complex taxonomy of their *Eriogonum* food plants, and the large number of museum specimens that are incorrectly determined to species-group (in these cases, male genitalia usually have not been examined). Considerable variation exists between individuals in any given population of *Euphilotes*, both in details of the configuration of the male and female genitalia, and wing characters in the adult butterflies. In addition, some adults of the different described species can be very similar to one another. To define species boundaries, recent authors have used a combination of food plant associations, biological studies of the immature stages, geographic isolation, isolation due to seasonal differences in adult flight periods, and adult morphology (various wing characters including ventral forewing suffusion, maculation, the aurora of the hind wing, wing borders and fringes, the amount and shade of blue dorsally, and male and female genitalia). Often, the food plant species for the taxon is more important in identifying the taxon to species or subspecies than is the external morphology of the butterfly.

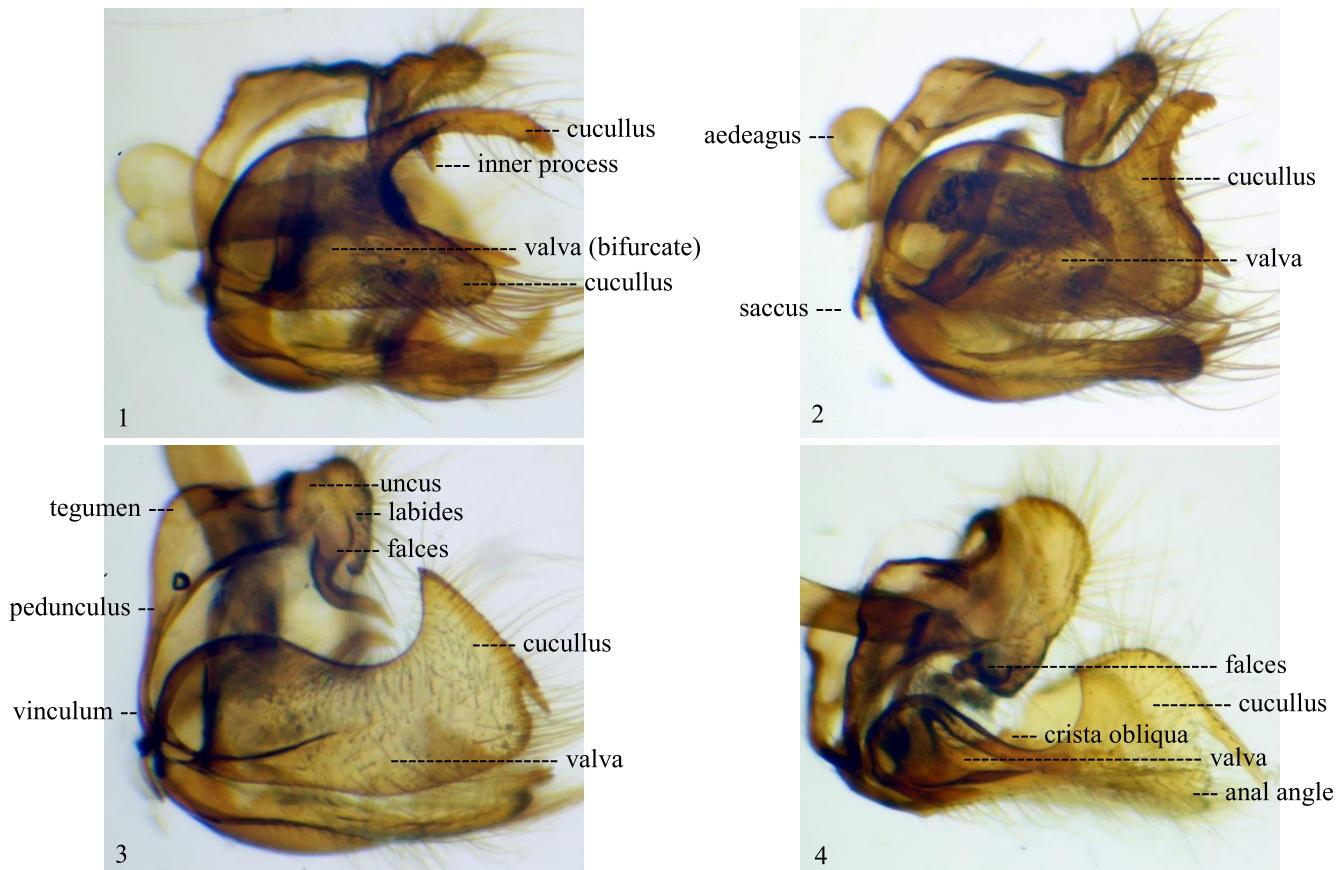

## MATERIALS AND METHODS

Specimens examined are deposited in the collections of the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville (MGCL); Oregon State Arthropod Collection, Oregon State University, Corvallis (OSAC); research material of Andrew D. Warren, Castle Rock, Colorado (ADW); private collections of Steve Kohler, Missoula, Montana (SK), and Dana Ross, Corvallis, Oregon (DR). Specimens that form the basis for other records cited herein are housed in American Museum of Natural History, New York, New York (AMNH); Essig Museum of Entomology, University of California, Berkeley, California (EMEC); California Academy of Sciences, San Francisco, California (MCAS); Museum of Comparative Zoology, Harvard University, Cambridge, Massachusetts (MCZC); Natural History Museum of Los Angeles County, Los Angeles, California (NHMLA); Peabody Museum of Natural History, Yale University, New Haven, Connecticut (PMNH); National Museum of Natural History, Smithsonian Institution, Washington, D. C. (USNM); University of Washington Burke Museum, University of Washington, Seattle, Washington (UWBM); William F. Barr Entomological Museum, University of Idaho, Moscow, Idaho (WFBM); Washington State University, Pullman, Washington (WSU).

Full data are provided for all *Euphilotes* specimens examined from Montana. In addition, full data are provided from other states and provinces for all specimens examined of newly described taxa. For most other taxa discussed herein, complete specimen data from MGCL, OSAC, and private collections have not been listed. Partial listings of specimens examined, with an emphasis on those examined by the senior author (SK), are provided for taxa occurring adjacent to those that exist in Montana or to accompany specimens figured in captions; in most cases, data from specimens examined of California-Nevada taxa described since 1998 have not been listed. For taxa discussed herein that also occur in Oregon, data from specimens examined leading up to the publication of Warren (2005) are provided; data obtained since 2005 generally are not.

Distribution maps were constructed using base topographical maps, to which were added the captions, legends and dots, visually placed in the approximate collection localities. Each finished map was then saved as a Word file. In addition to specimens we have personally examined, maps are populated with locality data provided by Shields (1975, 1977), Stanford & Opler (1993), Austin (1998), Layberry et al. (1998), Pratt & Emmel (1998, 2008), Davenport (2004a, b), Warren (2005) and Austin et al. (2008), when unambiguous.

Figures of the adult butterflies are shown at 1.6X life size and to scale. Both dorsal and ventral surfaces are shown for each specimen. Full data for each specimen is provided. Figures of the male and female genitalia are shown at approximately 50X magnification. For comparison, the entire genital capsule of each male is shown in the same position, with the left valva in lateral view, anterior left and posterior right. For the female genitalia, the sclerotized ventral portion (lodix) of the terminal segments of the female abdomen is shown in ventral view with the posterior end up. Previous authors of *Euphilotes* studies have used a variety of terms to describe the external structures and configuration of the male and female genitalia, at times using different terminology for the same structure. To avoid confusion when describing and comparing the various structures for the purpose of this review, we list below in glossary form the definitions upon which these comparisons will be made. The definitions are largely based on those from Ehrlich & Ehrlich (1961), Klots (1970) and Tuxen (1970). The locations of these structures are indicated on photos of the genitalia below.

Male genitalia of *Euphilotes* showing the shape of the left valva and the location of the associated structures. 1. *Euphilotes battooides* complex. 2. *Euphilotes oakleyi*. 3. *Euphilotes enoptes* complex. 4. *Euphilotes rita* complex. All shown in left lateral view.

## MALE GENITALIA

**Aedeagus:** Penis or phallus, the male intromittent organ.

**Anal angle:** An angle of the cucullus, forming the ventrocaudal angle of the valva.

**Crista obliqua (pl. cristae obliquae):** Oblique, dentate process of the median, basal region of the valva.

**Cucullus:** Distal portion of the valva.

**Falces (= gnathos):** Paired, heavily sclerotized, curved or angulate arms, articulated with the caudal margin of the tegumen ventrad of the base of the uncus and extending ventro-caudad.

**Labides:** Lobes of the uncus.

**Pedunculus:** Lateral part of the tegumen, articulating with the dorsal part of the vinculum.

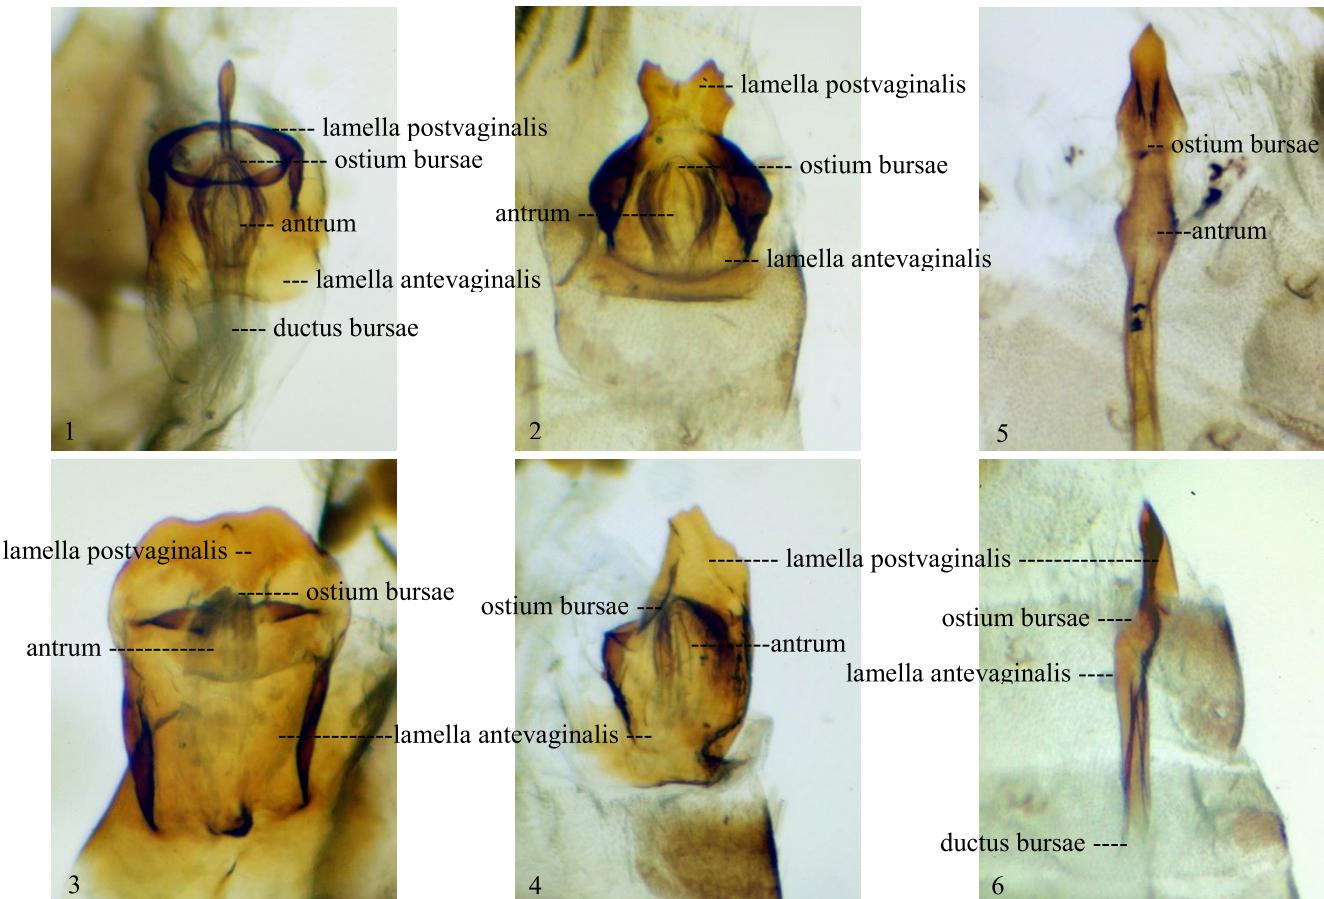

**Saccus:** Anterior projection from the base of the vinculum.

**Tegumen:** The dorsal basal structure of the male genitalia, roof-like or hood-like.

**Uncus:** The dorsal distal structure extending caudad from the tegumen.

**Valva (pl. valvae):** Paired, presumably clasping organs of the male genitalia.

**Vinculum:** The U-shaped sclerite to which the valvae are attached.

Female genitalia of *Euphilotes* showing the shape of the lodix and the location of the associated structures. 1. *Euphilotes batoides* complex, ventral view. 2. *Euphilotes oakleyi*, ventral view. 3. *Euphilotes enoptes* complex, ventral view. 4. Same, lateral view. 5. *Euphilotes rita* complex, ventral view. 6. Same, lateral view.

## FEMALE GENITALIA

**Antrum:** A bulbous, ribbed mating tube, the most caudal part of the ductus bursae when more heavily sclerotized and differentiated from the remainder of the ductus bursae.

**Bursa copulatrix:** A collective term for the structure comprised of the ostium bursae, antrum, ductus bursae and corpus bursae.

**Corpus bursae:** The enlarged sac-like distal part of the bursa copulatrix.

**Ductus bursae:** A tube of varying length, most commonly relatively narrow, and connecting the ostium bursae with the corpus bursae, including the antrum. Part of the bursa copulatrix.

**Lamella antevaginalis:** The part of the lodix which is cephalad and ventral of the ostium bursae.

**Lamella postvaginalis:** the part of the lodix which is caudad and dorsal of the ostium bursae.

**Lodix:** The entire complex of sclerotized structures surrounding the ostium bursae, consisting of the lamella antevaginalis and lamella postvaginalis, located mid-ventrally and caudad of the seventh sternite, which fit corresponding structures of the male genitalia and presumably serve to hold the mating individuals together. It is also called the genital plate or sterigma.

**Ostium bursae:** The copulatory entrance into the ductus bursae.

**Note:** No sharp distinction between the lamella antevaginalis and lamella postvaginalis is possible in *Euphilotes*, with the two being joined and surrounding the ostium bursae and antrum. Mattoni [1978], in erecting the genus stated “Lodix large subcuboid formed as a single apparent sclerite. Deeply invaginated into the seventh segment”.

## RESULTS AND CONCLUSIONS

Below, we review described and known undescribed populations of *Euphilotes*, with a special emphasis on those occurring in Montana and other northwestern states and Canadian provinces, at the northern distributional limit of the genus. We document the distributions of all *Euphilotes* populations known to occur in Montana, based on nearly five decades of extensive field work researching the butterfly fauna of Montana, by the senior author. We describe two new species and six new subspecies of *Euphilotes*, and figure adults and male and female genitalia of newly named taxa, as well as of other taxa as relevant in comparisons with new taxa. Full synonymies for all taxa discussed are provided by Pelham (2021).

Pratt & Emmel (1998) recognized three species complexes in *Euphilotes* and outlined characters of the male and female genitalia used to separate them. As a result of the current study, we have confirmed that the conformation of the valvae in the male genitalia and the lodix in the female genitalia have highly significant taxonomic value for specific, and in some cases, subspecific determination. In this study, we have refined the use of these differences in defining populations discussed below. The taxa we discuss are organized according to the three species complexes as defined by Pratt & Emmel (1998).

### THE EUPHILOTES BATTOIDES COMPLEX

Pelham (2021) included the following species in the *Euphilotes battoides* complex: *E. battoides* (Behr) (Figs. 235, 316), *E. bernardino* (W. Barnes & McDunnough) (Figs 236-237, 317-318), *E. allynii* (Shields), *E. glaucon* (W. H. Edwards) (Figs. 238-249, 319-323), *E. baueri* (Shields) (Figs. 261-271, 332-340), *E. centralis* (W. Barnes & McDunnough) (Fig. 272) and *E. ellisii* (Shields). Warren (2005) discussed two additional undescribed taxa in the *E. battoides* complex, treated at the species-level, in the Pacific Northwest. One of these, which is associated with *Eriogonum heracleoides* Nutt., is described below. The second taxon, endemic to high elevations in the Cascade Range and associated with *Eriogonum marifolium* Torr. & A. Gray, will be described by the authors in a subsequent publication. In this species complex, the male genitalia have bifurcate valvae, consisting of a broad lower portion and a narrow, usually curved upper prong of approximately equal length. In the female genitalia, the lodix is considerably reduced, being more ring-shaped.

#### *Euphilotes glaucon glaucon* (W. H. Edwards, 1871) (Figs. 1-22, 238-245, 319-321)

*Lycaena Glaucon* W. H. Edwards, 1871, Trans. Am. Entomol. Soc. 3(3/4): 205, 210, no. 9.

*Philotes glaucon glaucon* Edw.; McDunnough, 1938, Mem. S. Calif. Acad. Sci. 1: 28.

*Philotes battoides glaucon* (Edwards); dos Passos, 1964, Mem. Lepid. Soc. (1): 67; Langston, 1969, J. Lepid. Soc. 23(1): 50.

*Shijimaeoides battoides glaucon* (Edwards, 1871); Shields, 1977, J. Res. Lepid. 16(1):31.

*Euphilotes battoides glaucon* (W. H. Edwards); Miller & Brown, 1981, Mem. Lepid. Soc. (2): 118.

*Euphilotes battoides glaucon* (W. H. Edws.); Mattoni, 1989, J. Res. Lepid. 27(3/4): 175.

*Euphilotes battoides glaucon* (Edwards, 1871); Pratt & Emmel, 1998, Syst. W. N. Am. Butterflies (16): 216.

*Euphilotes glaucon glaucon* (W. H. Edwards, 1871); Warren, 2005, Butts. Ore.: 173; Pelham, 2008, J. Res. Lepid. 40: 247; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Nevada: Storey County; near Virginia City.

Mattoni (1989) was the first to suggest that *E. glaucon* may represent a species-level taxon. Warren (2005) elaborated on this hypothesis and applied the name broadly, as a wide-ranging polytypic species, to all populations in Oregon (then mostly known from the western half of the state) feeding on *Eriogonum umbellatum* Torr. This application was supported by adult morphology and the timing of

adult flight in populations occurring in sympatry and parapatry with other members of the *E. battooides* complex. Additional fieldwork in the Pacific Northwest since Warren (2005) has documented *Er. umbellatum*-feeding populations of *E. glaucon* in northeastern Oregon, on the east side of the Cascades in Washington, and at several sites in Montana. *Eriogonum umbellatum*-feeding populations of *E. "battrooides glaucon"* in western Montana were discussed by Shields (1977), but he listed only one record—Ravalli County. Kohler (1980) listed records of *E. "battrooides glaucon"* for only three Montana counties (Madison, Missoula [in error], and Ravalli). As discussed above, *E. glaucon* is now considered a species-level taxon. Since Kohler (1980), we have documented additional Montana localities for *E. glaucon*, as detailed below. The morphology of Montana populations of *E. glaucon* does not differ significantly from that of the nominotypical populations of the Great Basin.

Because of its use of (early blooming) *Er. umbellatum*, Davenport (2004a) treated *Euphilotes comstocki* (Shields, 1975) as a subspecies of *Euphilotes intermedia* (W. Barnes & McDunnough, 1917) (although Pelham (2021) includes *intermedia* as a subspecies of *E. glaucon*). This circumscription of *E. glaucon* also implies that some additional taxa (outside the range of taxa treated by Davenport), described as subspecies of *E. battooides* by Pratt & Emmel (1998) and so treated by Pelham (2008), should be associated with *E. glaucon*.

The known distribution of *E. g. glaucon* includes northern California, northern Nevada, western Oregon, southern Idaho, southwestern Montana and northern Utah (Fig. 383).

**Specimens Examined:** USA: IDAHO: Lemhi County: W. side Bitterroot Range, upper Cow Creek Rd. fork, off Lemhi Pass Rd., E. of Tendoy, 6205', 18 July 2006, T.W. Ortenburger, 1♂ (at mud) (ADW); MONTANA: Beaverhead County: near Lemhi Pass, 20 July 1982, S. Kohler, 4♂ (SK); Gold Cr., 6000', FR 73, 15 mi. S. Wise River, 30 June 2017, S. Kohler, 1♂ 1♀ (SK); Ravalli County: Railroad Creek, 4950', off Skalkaho-Rye Road, 25 June 1981, S. Kohler, 1♂ (SK); same locality, 25 June 2001, S. Kohler, 12♂ 3♀ (SK); Silver Bow County: Barrel Spring trail, 6100', 4-5 mi. NE of Melrose, 7 June 2004, S. Kohler, 8♂ 1♀ (SK); same locality, 1 June 2006, S. Kohler, 5♂ (SK); 5 June 2006, S. Kohler, 13♂ (SK); 6 June 2006, S. Kohler, 12♂ (SK); 30 May 2007, S. Kohler, 1♂ (SK); Barrel Spring trail, 5680', off Camp Creek Rd., 5 mi. NE Melrose, 15 June 2015, S. Kohler, 1♂ (SK); Camp Creek Road, 4-5 mi. E. of Melrose, 4 June 2004, S. Kohler, 1♂ (SK); same locality, 14 June 2004, S. Kohler, 3♂ (SK); Soap Gulch, 6980', 7 mi. up, NE Melrose, 15 June 2015, S. Kohler, 4♂ (SK); Soap Gulch, 6850-7150', 7-8 mi. up, NE Melrose, 17 June 2015, S. Kohler, 24♂ (SK); Soap Gulch, 6900', 6 mi. up, NE Melrose, 21 June 2016, S. Kohler, 4♂ (SK); Same locality, 23 June 2016, S. Kohler 2♂ 2♀ (SK); Soap Gulch, 6875-7300', 6-7 mi. up, NE Melrose, 24 June 2015, S. Kohler, 14♂ (SK); Same locality, 25 June 2015, S. Kohler, 4♂, (SK); Soap Gulch, 7300', 7 mi. up, NE Melrose, 3 July 2020, S. Kohler, 2♂, (SK); USA: NEVADA: Douglas County: US 395, 2.1 mi. S. Carson City line, 30 May 1980, G. T Austin, 4♂ 4♀ (SK); Clear Creek Canyon, 2 mi. NW US 395, 29 May 1980, G. T. Austin, 2♂ 2♀ (SK); Washoe County: 3 mi. E. US 395 on Hwy. to Virginia City, 19 June 1980, J. B. Vernon, 4♀ (SK); OREGON: Deschutes County: Hwy. 20, 1.5 mi. E. Millican, 8 June 2003, assoc. *Er. umbellatum*, A.D. Warren, 1♂ 1♀ (ADW); Rd. 16, 1-2 mi. S. Sisters, 7 June 2003, assoc. *Er. umbellatum*, A.D. Warren, 23♂ 11♀ (ADW) (some males in the population have widened dark wing margins, approaching the phenotype seen in *E. g. oregonensis*); Sisters, 8 July 1953, S. Jewett, 2♂ 3♀ (OSAC); same locality, 24 June 1954, J. C. Downey, 1♀ (MGCL); Grant/Baker counties: Elkhorn Mts., saddle at 8000', 24 July 2005, D. Trochlell, 2♂ 3♀ (ADW); Harney County: Hwy. 20, mi. 85, just W. of Lake Co. line, 10 June 2003, assoc. *Er. umbellatum*, A.D. Warren, 3♂ 1♀ (ADW); Steens Cirque, 26 July 2000, D. Ross, 1♂ 1♀ (DR); Steens Mtn., Wildhorse Lake, 8450', 21 June 1992, D. Ross, 1♂ 1♀ (DR); Steens Mt., 25 July 1936, S. Jewett, 1♂ (OSAC); same locality, 19 July 1957, R. Albright, 1♂ 1♀ (OSAC); 18 July 1958, 1♂ 2♀ (OSAC); Steens Mt., E. rim overlook, 11 July 2000, D. Ross, 1♀ (DR); Steens Mtn., trailhead to summit, 25 July 1997, D. Ross, 2♂ 1♀ (DR); summit of Steens Mt., 9600', 28 July 1958, D. Jewett, 1♀ (OSAC); same locality, 17 July 1968, S. Dornfeld, 1♀ (MGCL); 1♂ 2♀ (OSAC); 15 August 1971, S. Dornfeld, 1♂ (MGCL); 2 August 1975, Hinchliff, 1♂ 2♀ (OSAC); Jackson County: Burnt Ck. Ranch Rd., 2 mi. S. Dead Indian Rd., 5400', 1 July 1991, 1♂ (OSAC); Hyatt Lake, 9 June 1940, 1♂ (SK); Hyatt Prairie Rd., 1.2 mi. N. Hwy. 66, ca. 4750', on *Er. umbellatum*, 2 June 2000, A.D. Warren, 1♂ 1♀ (ADW); near summit, Mt. Ashland, 6600', assoc. *Er. umbellatum*, 23 June 2000, A. D. Warren, 3♂ (ADW); same locality and plant association, 19 July 1997, D. Ross, 1♀ (DR); many more from this locality (OSAC); N. Fork Scotch Ck. Cyn. and Lone Pine Ridge, 3800-4600', on *Er. umbellatum*, 27 June 2000, A.D. Warren, 1♂ 1♀ (ADW); meadow above Soda Mtn. Rd., 3.8 mi. S. of jct. with Hwy. 66, 4900', 21 June 2000, R.L. Romeyn 2♂ 2♀ (SK); Soda Mtn. Rd. to Hobart Peak (ca. 3 mi. S. Hwy. 66), 5200-5450', on *Er. umbellatum*, 22 June 2000, A.D. Warren, 3♂ 4♀ (ADW); Jefferson County: along Metolius River at lower bridge, ca. 8 mi. N. Metolius Spring, 2300', 31 May 2002, at mud but assoc. *Er. umbellatum*, 1♂ (ADW); Canyon Creek Meadows, 30 July 1978, [V. McHenry], 3♂ (OSAC); Metolius River, 10 July 1952, S. Jewett, 1♂ (OSAC); Rd. 11 at jct. Meadow Creek, E. side of Green Ridge, ca. 3200', 2 June 2003, assoc. *Er. umbellatum*, A.D. Warren, 4♂ 2♀ (ADW); Klamath County: Bly Mtn., 5000', 16 June 1963, E. Dornfeld, 3♂ (OSAC); same locality, 17 June 1963, E. Dornfeld, 1♂ 1♀ (OSAC); 22 June 1959, E. Dornfeld, 2♂ (OSAC); 21 June 1958, R. Woody, 3♂ (OSAC); Keno, 30

May 1939, S. G. Jewett, 1♂ (MGCL); 8♂ 8♀ (OSAC); Hwy. 66, at W. end jct. Hwy. 97, SW edge Klamath Falls, 4000', 18 June 2003, assoc. *Er. umbellatum*, A.D. Warren, 3♂ 6♀ (ADW); **Lake County:** Chandler State Park, 12 mi. N. Lakeview, 16 June 1958, E. Dornfeld, 1♂ (OSAC); Hwy. 20, mi. 81, ENE Glass Buttes, ca. 4500', 9 June 2003, assoc. *Er. umbellatum*, A.D. Warren, 3♂ 1♀ (ADW); same locality, 10 June 2003, assoc. *Er. umbellatum*, A.D. Warren, 3♂ 4♀ (ADW); Lost Forest nr. Christmas Valley, 16 June 1970, 1♂ (OSAC); Warner Mts., Kelly Creek, T40S R21E S9, 4810', 13 June 1999, V. Covlin, 1♂ (ADW).

**Additional Records:** The following include published records or others known to us. Specimens have not been examined.

**USA: IDAHO: Lemhi County:** Fourth of July Cr. at Blacktail Cr., 17 June 1999, L. May (WFBM); Salmon River Rd., 41 mi. SW North Fork, 26 June 1999, L. May (WFBM); **MONTANA: Madison County:** C. Durden (reported to R. E. Stanford, 1978; these could be the new taxon described from Madison County, below); **Ravalli County:** Sula, 4700', 23 June 1929, 1♂ (WFBM) (Shields, 1977).

*Euphilotes battoides oregonensis* (B. & McD.); Mattoni, 1989, J. Res. Lepid. 27(3/4): 175.

*Euphilotes battoides oregonensis* (Barnes & McDunnough, 1917); Pratt & Emmel, 1998, Syst. W. N. Am. Butts. (16): 220.

*Euphilotes glaucon oregonensis* (Barnes & McDunnough, 1917); Warren, 2005, Butts. Ore.: 173; Pelham, 2008, J. Res. Lepid. 40: 247; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Oregon: [Klamath County]; Crater Lake.

Typical *E. g. oregonensis* occurs in the pumice flats and low hills of central Klamath County, Oregon (e.g., Sand Creek area, ca. 4800'; south entrance to Crater Lake National Park), north to extreme southwestern Deschutes County (Fig. 383). As with other *E. glaucon* populations, it is associated with *Er. umbellatum*. Adults of *E. g. oregonensis* fly mostly from mid-June to mid-July. Males are dark blue above, usually with very wide dark wing borders (Fig. 23). Above, females are dark brown, with a narrow orange aurora (Fig. 25). Below, both sexes have a ground color similar to *E. g. glaucon*, and the spot size averages somewhat larger (Warren, 2005) (Figs. 24, 26).

**Specimens Examined:** USA: OREGON: **Klamath County:** Antelope Desert, W. of Hwy 97 at mi. 226.6, 22 June 2017, B. A. O'Hara, 1♂ 2♀ (SK); Antelope Desert, Sand Creek area, flats W. Hwy. 97 at mi. 226, 4557', 29 June 2017, R. L. Romeyn, 5♀ (SK); Crater Lake, 11 July 1925, 1♂ 3♀ (OSAC); same locality, 12 July 1937, 4♂ (SK); 27 July 1933, 1♂ (SK); 11 July 1930, 2♀ (MGCL); 23 July 1944, 2♂ (OSAC); 26 July 1963, Hinchliff, 2♂ 2♀ (OSAC); 18 July 1970, D. W. Jenkins, 1♂ 2♀ (MGCL); 22 July [??], 1♂ (MGCL); Crater Lake N. P., 17 July 1944, B. Weber, 2♂ 10♀ (MGCL); same locality, 23 July 1944, B. Weber, 5♂ 4♀ (MGCL); Hwy. 97, vic. mi. 226.4, ca. 4700', on *Er. umbellatum*, 21, 28 June 2000, A. D. Warren, 48♂ 25♀ (ADW); same locality and plant association, 23 June 2001, A. D. Warren, 2♂ 2♀ (ADW); same locality, association and date, D. Ross, 6♂ 5♀ (DR); 18 June 1992, D. Ross, 5♂ 3♀ (DR); 17 June 2000, D. Ross, 7♂ 2♀ (DR); Sand Creek, Hwy. 232, 3 July 1968, E. J. Dornfeld, 1♂ (MGCL); 0.9 mi. N. Sand Creek, and W. of US 97, 4500', 18 June 2006, J. & F. Preston, 1♂ (MGCL); 1.6 mi. E. Hwy. 97, 9 mi. N. Kirk, 4650', 27 July 1964, E. M. & S. F. Perkins, 2♂ (MGCL); 5 mi. N. Sun Pass, Hwy. 232, 4750', 10 July 1962, 1♀ (MGCL).

***Euphilotes glaucon australoglacon*** Pratt & J. Emmel, 1998  
(Figs. 27-30)

*Euphilotes battoides austroglaucon* Pratt & J. Emmel, 1998, Syst. W. N. Am. Butts. (16): 216-217.

*Euphilotes glaucon australoglacon* Pratt & J. Emmel, 1998; Pelham, 2008, J. Res. Lepid. 40: 247; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** California: Inyo County; east slope Sierra Nevada, Independence Creek, 6300' elevation.

Pratt & Emmel (1998) considered this taxon to be “ecologically very close to subspecies *glaucon*”, but treated both as subspecies of *E. battoides*. Davenport (2004b), who stated, “The occurrence of *battoides* on Glass Mountain well east of the Sierra Nevada within the range of *glaucon* suggests that these may be two different species”, aligned *astraloglacon* with *E. glaucon*, an arrangement followed by Pellham (2008). This taxon differs from nominate *glaucon* mainly in the presence of extensive bluish scaling above on many (but not all) females, and a somewhat paler blue color above in males. As reported in its original description, *E. g. astraloglacon* uses *Eriogonum umbellatum* Torr. var. *nevadense* Gandy as its larval food plant. This taxon was reported (Pratt & Emmel, 1998) to occur along the east slope of the Sierra Nevada in California, from about the latitude of Lone Pine in Inyo County, north to the Sherwin Grade of the south part of Mono County (Fig. 383).

**Specimens Examined:** USA: CALIFORNIA: **Inyo County:** S. Fork Bishop Creek Canyon, S. of South Lake Rd., 0.2 mi. W. of Mountain Glen CG, 8600', 20 June 2017, assoc. *Er. umbellatum*, R. L. Romeyn, 1♂ (SK); flats S. FR 7S01, 4.5 mi. W. Hwy. 168 via Buttermilk Rd., 6840', Sierra Nevada Mts., 23 May 2017, R. L. Romeyn, 11♂ 9♀ (SK); **Mono County:** S. facing slope along upper Rock Creek Rd., 8500', 2.5-3.4 mi. W. of jct. with Hwy. 395, 1 July 2011, assoc. *Er. umbellatum*, R. L. Romeyn, 1♂ 1♀ (SK); NW jct. of Hwy. 395 and McGee Creek Rd., 7050', Sierra Nevada Mts., 7 June 2016, assoc. *Er. umbellatum* var. *nevadense*, R. L. Romeyn, 13♂ 16♀ (SK).

***Euphilotes glaucon comstocki*** (Shields, 1975)

*Shijimiaeoides battoides comstocki* Shields 1975, Bull. Allyn Mus. (28): 12.

*Euphilotes battoides comstocki* (Shields); Miller & Brown, 1981, Mem. Lepid. Soc. (2): 118; Mattoni, 1989, J. Res. Lepid. 27(3/4): 175.

*Euphilotes battoides comstocki* (Shields, 1975); Pratt & J. Emmel, 1998, Syst. W. N. Am. Butts. (16): 220.

*Euphilotes intermedia comstocki* [Shields]; Davenport, 2004a, Tax. Rept. Int. Lepid. Surv. 4(7): 10.

*Euphilotes glaucon comstocki* (Shields, 1975); Pelham, 2008, J. Res. Lepid. 40: 248; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** California: Kern County; Tehachapi.

In the original description, Shields (1975) stated that *comstocki* was known only from the type locality (Tehachapi, Kern Co., California), and that the larval host was an unknown *Eriogonum* species. Pratt & Emmel (1998) noted that *comstocki* is phenotypically much like *E. g. glaucon*, though it has slightly narrower orange aurorae and smaller macules, and has a slightly later emergence, feeding on a later-blooming *Er. umbellatum*. Davenport (2004a) stated that Pratt (pers. comm.) had concluded that *comstocki* was better placed with *intermedia* than *battoides*. He also noted recent records expanding the known distribution of *comstocki* in California as follows: Piute Mtn. Vista, Piute Mts., Kern Co. (Jim Brock); Kennedy Meadows, Kern Plateau, Tulare Co. (James Scott); Bald Mountain, Kern Plateau, Tulare Co., Pine Flat at the south end of the Kern Plateau, the Piute Mtn. Rd. overlooking Lake Isabella and several sites in the Greenhorn Mts., all Kern Co. (Ken Davenport). Davenport (2004a) also noted that *E. g. comstocki* is common in its localized habitats where its larval food plant is *Er. umbellatum*. The distribution is shown in Fig. 383.

***Euphilotes glaucon intermedia*** (W. Barnes & McDunnough, 1917)  
(Figs. 31-34, 249)

*Philotes battoides intermedia* B. & McD., 1917, Contrib. Nat. Hist. Lepid. N. Am. 3(4): 214.

*Philotes glaucon intermedia* B. & McD.; McDunnough, 1938, Mem. S. Calif. Acad. Sci. 1: 28.

*Euphilotes battoides intermedia* (B. & McD.); Mattoni, 1989, J. Res. Lepid. 27(3/4): 175.

*Euphilotes battoides intermedia* (Barnes & McDunnough, 1917); Pratt & Emmel, 1998, Syst. W. N. Am. Butts. (16): 220.

*Euphilotes intermedia* (Barnes & Benjamin); Davenport, 2004a, Tax. Rept. Int. Lepid. Surv. 4(7): 10.

*Euphilotes glaucon intermedia* (Barnes & McDunnough, 1917); Warren, 2005, Butts. Ore.: 173; Pelham, 2008, J. Res. Lepid. 40: 247; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** [California]: Shasta County; (presumably in the vicinity of Castella in the Upper Sacramento Valley).

Mattoni (1989) noted that *intermedia* is sympatric and synchronic with *E. b. battoides* at Gold Lake, California, and Warren (2005) allied *intermedia* with *E. glaucon*, since they become indistinguishable in southwestern Oregon. This arrangement was followed by Pelham (2008). The distribution of *E. g. intermedia* includes northern and east-central California (Fig. 383). Warren (2005) discussed Oregon populations of *E. glaucon* from Josephine and Curry counties which he called *Euphilotes glaucon* nr. *intermedia*. Adults from these two counties differ from typical *E. g. intermedia* by having somewhat better-developed dark wing margins and darker blue males above, and in having slightly bolder spots below. The two taxa share the same pale ventral ground coloration. He also discussed another unique population from along the western slope of the Cascades in Lane County, apparently related to *E. g. nr. intermedia*. Adults from this population average larger than those from Josephine and Curry counties and males are darker blue above, with somewhat wider dark wing margins. Below, adults of the Lane County segregate have very small discal spots (some spots are occasionally absent), and ground color is whitish, even paler than that of *E. g. nr. intermedia*. However, ventral hind wing aurorae are bold and well-developed on adults in Lane County, and contrast strongly with the otherwise mostly immaculate ventral surface. These populations will be treated by the authors in greater detail in a subsequent publication, but for now are mapped as *E. g. intermedia* (Fig. 383).

Populations of *E. glaucon* in Jackson, southern Klamath, and southern Lake (Warner Mts.) counties of southwestern Oregon are highly variable. Adults from these populations generally resemble *E. g. glaucon*, though occasional males approach the appearance of *E. g. oregonensis* with somewhat widened dark wing margins. For now, all of these populations are mapped (Fig. 383) as *E. g. glaucon*.

***Euphilotes glaucon*** (W. H. Edwards, 1871) (N. Oregon-Washington Cascades segregate)  
(Figs. 35-38, 247-248, 322-323)

Warren et al., 2016, Illustrated lists of American butterflies, Revised 21 Nov. 2017, Accessed 19 Feb., 2021, <http://www.butterfliesofamerica.com>.

Warren (2005) discussed a population of *E. glaucon* that occurs at the north end of the Cascades in Oregon, at and above tree line on Mt. Hood (Clakamas and Hood River counties), and referred to it as *Euphilotes glaucon* nr. *glaucon*. These populations occur in association with *Eriogonum umbellatum* var.

*haussknechtii* (Dammer) M.E. Jones, and adults are phenotypically most similar to *E. g. glaucon*. However, adults from the Mt. Hood area differ from nominate *E. glaucon* in having paler blue males, wing fringes not strongly checkered, and a somewhat darker ventral coloration (Figs. 35-38). Adults fly well into August on Mt. Hood, and probably begin to fly shortly after the snow has melted in their habitats. Similar populations of *E. glaucon* also occur in the vicinity of Mt. Adams in Yakima County, Washington and perhaps further north on the eastern slope of the Cascades in Washington (Fig. 383). *Euphilotes glaucon* may range considerably further north in the Washington Cascades than Mt. Adams, as suggested by the additional records listed below. Whether or not some of these populations could represent *E. umbellatum*-feeding populations of the new species described below, which normally utilizes *Er. heracleoides* as a larval food plant, remains to be fully investigated. We will treat these populations in greater detail in a subsequent publication.

**Specimens Examined:** USA: OREGON: Clackamas County: Timberline Lodge, [Mt. Hood], 21 July 1979, 1♀ (OSAC); Clackamas/Hood River Counties: Mt. Hood, NW Timberline Lodge, 5700-6000', 20 July 2003, on *Er. umbellatum* var. *haussknechtii*, A. D. Warren, many males and females (ADW); Hood River County: Lookout Mtn., 6600', 22 July 1978, Hinchliff, 1♂ 2♀ (OSAC); S. slope of Mt. Hood, above Timberline Lodge, 6 August 2010, assoc. *Er. umbellatum*, B. O'Hara, 1♂ 1♀ (SK); WASHINGTON: Yakima County: vic. Bird Meadows, Mt. Adams, 7 August 1953, S. Jewett, 1♂ OSAC); Bethel Ridge Microwave Tower Rd., 18 July 2009, assoc. *Er. umbellatum*, K. Kendall, 1♂ SK); same locality, 18 July 2009, assoc. *Er. umbellatum*, D. Nunnallee, 1♂ (SK); same locality, 18 July 2009, assoc. *Er. umbellatum*, R. M. Pyle, 1♀ (SK).

**Additional records:** USA: WASHINGTON: Chelan County: Entiat Summit Road, 5550' collected a large sample of *Eriogonum umbellatum* var. *hausknechtii* for larvae, 6 August 2006, 19 larvae obtained 12 August 2006, adults pinned, 10 September 2010, D. & J. Nunnallee; Chumstick Mountain summit, 5810', 24 July 2007, on *Er. umbellatum*, D. & J. Nunnallee, 12 adults including ♂♀; Derby Canyon 3055-3075', 11 July 2010, J. Pelham, D. & J. Nunnallee, A. Warren, J. Lane, on *Er. umbellatum hausknechtii*; same locality, 27 July 2011, assoc. *Er. umbellatum*, 4♀; NF 7100, Derby Canyon, 27 July 2011, assoc. *Er. umbellatum*; NF 7400, 4692', 27 July 2011, assoc. *Er. umbellatum*, D. & J. Nunnallee, sample collected; Chumstick Mountain summit, 5780-5829', 6 August 2011, on *Er. umbellatum hausknechtii*, D. & J. Nunnallee; Kittitas County: Reecer Creek Road, 4800' 15 July 2010, nectaring on *Er. umbellatum*, D. & J. Nunnallee, 1♀; same locality, collected *Er. umbellatum* flowers, 5 August 2010, found 1 nearly mature larva, 7 August 2010, found 3 pupae, 20 September 2010, obtained adults; same locality, 13 July 2011, on *Er. umbellatum*, D. & J. Nunnallee, 2♂; Stevens County: Cottonwood Divide Road, Chewelah Mountain, 5070', 22 July 2012, B. Yake, J. Barreca; Chewelah Mountain Summit, 5560-5773', 22 July 2012, assoc. *Er. umbellatum*, B. Yake, J. Barreca; same locality, 5760-5780', 1 August 2012, assoc. *Er. umbellatum*, D. Nunnallee, mostly ♀; Yakima County: Mt. Adams, south side via trail, 6000', 11 June 2012, D. & J. Nunnallee; Bird Creek Meadows Trail, 5820' 11 August 2012, assoc. *Er. umbellatum* dwarf mountain variety, D. & J. Nunnallee, 1♀; Bethel Ridge Microwave Tower, 6080-6223', 18 July 2009, strongly attracted to *Er. umbellatum* plants, D. & J. Nunnallee, 5 voucher adults collected.

### ***Euphilotes heracleoides* Kohler & A. Warren – new species**

(Figs. 39-60, 250-260, 324-331)

ZooBank registration: [urn:lsid:zoobank.org:act:F72E0453-D30A-4E39-AF2D-61DB7D595CEB](http://urn:lsid:zoobank.org:act:F72E0453-D30A-4E39-AF2D-61DB7D595CEB)

Warren (2005), who was the first to diagnose this taxon, treated it as an undescribed species, and discussed its morphological and ecological attributes in detail. As early as 2000, Kohler found what appeared to be two different species of *Euphilotes* in the *battoides* complex occurring at the same locality in Sanders County, Montana. The area has an extensive stand of *Eriogonum ovalifolium*, Nutt. var. *pansum* Reveal as well as a considerable amount of *Er. heracleoides*, Nutt. The first *Euphilotes* species (*E. baueri* subspecies, see below) begins to fly when the *Er. ovalifolium* is in the full pre-bloom stage, which typically occurs in early May. The *Er. heracleoides* in the same area blooms about one month later, in early to mid-June, and the second *battoides* complex *Euphilotes* species, *E. heracleoides* is associated with it.

**Definition:** As its name implies, *Euphilotes heracleoides* is found almost everywhere *Eriogonum heracleoides* var. *heracleoides* Nutt. (Fig. 378, upper left) is abundant. While all *Euphilotes* are directly associated with their larval food plants, few taxa are as reliable among random searches of unfamiliar stands of *Eriogonum* as *E. heracleoides*. However, this species does appear to use *Er. douglasii* Benth. as a larval food plant at some sites in Washington (as indicated below) and possibly in northern Oregon as

well (Warren, 2005). At sites where *Er. heracleoides* grows in sympatry with *Er. umbellatum* (e.g., summit of Pine Mountain, Deschutes County, Oregon), adults strongly orient towards and perch (e.g., for the night) on flowers of *Er. heracleoides*, and show interest in *Er. umbellatum* only rarely, apparently to seek nectar. At one site in Lincoln County, Montana, where *Er. heracleoides* grows in sympatry with *Er. flavum* Nutt., adults of *E. heracleoides* occasionally perch or nectar on the *Er. flavum*. At another site in Lincoln County, a long series of both males and females was collected on *Er. flavum* and no other *Eriogonum* were present, strongly indicating that at this site, *E. heracleoides* may be utilizing *Er. flavum* as a larval food plant.

Adult *E. heracleoides* males are bright blue above, with fairly bold black wing margins. The orange aurora of the dorsal hindwing is variable from none (Figs. 43, 53) to just a hint (Fig. 39), to more extensive (Fig. 45). The majority of male individuals have little to no dorsal orange. Females are warm brown dorsally, and usually have a somewhat broad orange aurora. Ventrally, both sexes of *E. heracleoides* are quite similar to *E. g. glaucon* in having a bold forewing spot pattern and suffusion of dark scales at the base of both forewings and hindwings, however, in *E. g. glaucon*, the suffusion continues out into the discal portion of both the forewing and hindwing, while in *E. heracleoides* the discal area is free of suffusion, allowing the light gray ground color to be more visible, giving the ventral wing surfaces a brighter appearance. The genitalia are typical of the *E. battooides* complex, with males having bifurcate valvae (Figs. 250-260), and females with the lodix ring-shaped (Figs. 324-331).

The life history of *E. heracleoides* was recorded by James & Nunnallee (2011), as “Cascadia Blue”, *Euphilotes* on *Eriogonum heracleoides* (undescribed). They reared or partially reared *E. heracleoides* on *Er. heracleoides* on several occasions, most frequently from partially grown larvae found on buckwheat flowers, which pupated and eclosed as adults the following spring. They estimated the development period from egg-hatch to pupation to be approximately 25 days. During development, the larvae fed first on flowers and later on the developing seeds after the petals had senesced. As detailed by James & Nunnallee (2011), the most closely related species, *E. glaucon*, is fairly distinct from *E. heracleoides* in several immature stages. The egg of *E. glaucon* has a much less conspicuous micropyle, and the first instar larva is much lighter in color and has more extensive dorsal setae. In *E. glaucon* the second instar larva is pale off-white and the third instar larva is generally pale, while the *E. heracleoides* second instar larva is red and white, and it is strongly colored and maculated in the third instar. The fourth instar of *E. heracleoides* is variable, ranging from pale gray with diffused red markings to having much brighter red markings, while this stage in *E. glaucon* is less brightly marked.

**Etymology:** This species is named after its primary food plant, *Eriogonum heracleoides*. While it may use other species of *Eriogonum* food plants in some areas (see below), any *Euphilotes* found in close association with *Er. heracleoides* in Oregon, Washington, British Columbia, Idaho and Montana, is very likely to be *Euphilotes heracleoides* (although *Euphilotes a. ancilla* is associated with this plant in Nevada (see below), and might be associated with it in far southern Idaho).

**Distribution and Phenology:** *Euphilotes heracleoides* is known from essentially all sites north of Nevada where *Eriogonum heracleoides* is abundant (Fig. 384). This range includes most of northeastern Oregon, including Baker, Crook, Deschutes, Gilliam, Grant, Harney, Jefferson, Malheur, Morrow, Sherman, Umatilla, Union, Walla Walla and Wasco counties. The report by Hinchliff (1994) of *Euphilotes* “*battrooides*” from Wheeler County, Oregon, almost certainly refers to *E. heracleoides* as well. The species flies across most of eastern Washington; specimens were examined from Chelan, Columbia, Klickitat, Kittitas and Okanogan counties. Records for *E. “battrooides”* in Hinchliff (1996) suggest that this taxon also occurs in Adams, Asotin, Benton, Douglas, Ferry, Franklin, Garfield, Grant, Lincoln, Pend Orielle, Spokane, Stevens, Walla Walla, Whitman and Yakima counties. Washington records recently received from Jonathan Pelham (pers. comm., 2021; see below) confirm all of these counties (Fig. 384). As study of museum collections has shown, the great majority of records for *E. “battrooides glaucon”* from Washington (e.g., Pratt & Emmel, 2008) represent *E. heracleoides*, although the distribution of *E. glaucon* there remains poorly known (see above). *Euphilotes heracleoides* appears to be common in much of western Idaho, where *Er. heracleoides* is widespread, at least including Boise, Camas, Elmore, Latah and Lewis counties, based on specimens we examined (Fig. 384). Few specimens from the *E.*

*battoides* complex are available from far southern and eastern Idaho, and almost no information on food plant associations from that region is known. Thus, the southeastern distribution of *E. heracleoides* remains to be determined, in conjunction with that of *E. glaucon*.

The distribution of *E. heracleoides* in Montana includes only the far northwestern portion of the state, in Flathead, Lake, Lincoln and Sanders counties (Fig. 384). However, *Er. heracleoides* is found farther south in the western end of Montana (Beaverhead, Gallatin and Madison counties) and also in north central (Chouteau County) areas of the state (Lesica, 2012). Additional field work is needed to determine if any populations of *E. heracleoides* are present in these additional areas where the food plant occurs. Apparently, all records for the *E. battoides* complex from British Columbia, all from the extreme south-central part of the province, represent *E. heracleoides*.

It remains somewhat unclear how far south the distribution of *Euphilotes heracleoides* extends. The apparent occurrence of this species in the Warner Mountains of Lake County, Oregon (see additional records below and Warren, 2005) suggests that it may also occur in parts of the same range in Modoc County, California. Reports of both *Euphilotes g. glaucon* and *E. g. oregonensis* (as a subspecies of *intermedia*) from the Warner Mountains of Modoc County, California, by Pratt & Emmel (1998, 2008) may imply that their “*oregonensis*” refers to the same taxon we herein consider to be *E. heracleoides*; we do not consider the Warner Mountains to be part of the range of *E. g. oregonensis* (see above), although acknowledge that populations of *E. glaucon* in this range appear to be highly variable, with some adults approaching the dark-margined phenotype of *E. g. oregonensis*. Obviously, further research on *Euphilotes* in the Warner Mountains is needed.

As with most *Euphilotes*, the adult flight time of the single brood of *E. heracleoides* usually coincides with the period just before the peak blooming time of its *Eriogonum* food plant, but adults can sometimes be found for some time after the peak blooming period, although generally in worn condition. Records of adults in Montana extend from 1 June through 9 July at 2900-3600’ elevation, but Oregon flights can be earlier; late April to mid-July at elevations from 1500-7500’ (Warren, 2005), as indicated by material examined. The timing of adult flights of any population may be variable on an annual basis, as a result of local weather conditions.

**Types:** Holotype male: **MONTANA: Sanders County:** W. of Niarada, 3 June 2004, S. Kohler Coll. (47.81588, -114.62969). Allotype female: **MONTANA: Sanders County:** 1.5 mi. N. of Niarada, 13 June 1996, S. Kohler Coll. (47.82988, -114.61261). Paratypes: **MONTANA: Sanders County:** 2 mi. W. of Niarada, 3300’, 14 June 1996, S. Kohler, 45♂ 52♀; 1.5 mi. W. of Niarada, 9 June 1997, S. Kohler, 6♂ 5♀; same locality, 1 June 2000, S. Kohler, 19♂ 12♀; same locality, 2 June 2000, S. Kohler, 13♂ 14♀; 5 mi. SW of Niarada, 8 June 2000, S. Kohler, 2♂; SW of Niarada, 15 June 2001, S. Kohler, 10♂ 4♀; SW of Niarada, 19 June 2001, S. Kohler, 19♂ 4♀; West of Niarada, 3 June 2004, S. Kohler, 32♂ 8♀ (all collected in association with *Eriogonum heracleoides* var. *heracleoides*).

**Deposition of Types:** The holotype male, allotype female and four male and four female paratypes will be deposited in the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida. The remaining paratypes are in the Kohler Collection.

**Type Locality:** USA: MONTANA: Sanders County: vicinity of Niarada.

**Additional Specimens Examined:** (All collected in association with *Eriogonum heracleoides* var. *heracleoides*). USA: **IDAHO: Boise County:** FR 380, from summit of Mores Pass, 7119’, 43° 56.796’, 115° 41.029’, 14 July 2005, T. W. Ortenburger, 6♂ (ADW); **MONTANA: Flathead County:** 1.5 mi. N. of Niarada, 13 June 1996, S. Kohler, 23♂ 8♀ (SK); **Lake County:** 3 mi. E. Hot Springs, 3600’, 20 June 1996, S. Kohler, 9♂ 6♀ (SK); **Lincoln County:** Dancing Prairie, NW Eureka, 3350’, 1 July 1996, S. Kohler, 6♂ 6♀ (SK); Dancing Prairie, 5 mi. NW Eureka, 25 June 1997, S. Kohler, 3♂ 4♀ (SK); Burma Road, NE Eureka, 9 July 1999, S. Kohler, 1♀ (SK); same locality, 6 July 2005, S. Kohler, 1♂ 4♀ (SK); Dancing Prairie, NW Eureka, 28 June 2011, S. Kohler, 46♂ 26♀ (SK); same locality, 6 July 2011, S. Kohler, 1♂ 2♀ (SK); lower Burma Road, state section, NE of Eureka, 6 July 2011, 1♂ 1♀ (SK); S. Burma Road, 0.8 mi. SE Hwy. 93, 2840’, 5 June 2018, S. Kohler, 46♂ 11♀ (SK); **Sanders County:** 13 mi. N. of Perma, 13 June 1996, S. Kohler, 8♂ 3♀ (SK); 4.5 mi. N. Camas prairie, 9 June 1998, S. Kohler, 38♂ 22♀ (SK); 1 mi. west of Perma, 11 June 2013, S. Kohler, 29♂ 28♀ (SK); 1 mi. west of Perma, south of Hwy. 200, 2675’, 19 June 2017, S. Kohler, 10♂ 5♀ (SK); **OREGON: Baker County:** Blue Mts., Elkhorn Range, Rock Ck. Cyn., 1-2 mi. SW Nat. For. boundary, 21 June 2002, A. D. Warren, 1♂ 1♀ (ADW); **Grant County:** Aldrich

Mts., Fields Creek Cyn., vic. jct. Rd. 21 and NFD 2140, 4000-4200', 28 May 2001, A. D. Warren, 2♂ (ADW); same locality, 16 June 2001, A. D. Warren, 4♂ (ADW); Aldrich Mts., Fields Creek Rd., T14S R28E, 23 June 1995, D. Ross, 1♂ (DR); Wickup Ck., 0-1 mi. S. jct. Canyon Ck., S. of C.G., ca. 4600', 20 June 2002, A. D. Warren, 1♂ (ADW); Rd. 16, 2-3 mi. W. Malheur Co. line, ca. 5000', 20 June 2002, A. D. Warren, 1♀ (ADW); **Harney County:** Blue Mts., King Mtn. Lookout, ca. 6500', 16 June 1996, V. Covlin, 2♂ 2♀ (ADW); same locality, 25 June 1997, V. Covlin, 1♂ 2♀ (ADW); **Malheur County:** Bendire Mtn. – Hunter Creek area, ca. 6 mi. N. Beulah Res. on Bendire Rd., 4100-4500', 17 May 2002, A. D. Warren, 1♂ (ADW); **Malheur/Baker counties:** N. end Sheephead Mtn. to E. Camp Creek Rd., 2-4 mi. W. Hwy. 26, 4700-4900', 20 June 2002, A. D. Warren, 10♂ 2♀ (ADW); **Morrow County:** Blue Mts., Rd. 53, 4 mi. W. Umatilla Co. line, ca. 5200', 26 June 2002, A. D. Warren, 1♂ (ADW); **Umatilla County:** Blue Mts., Hwy. 244 at Lake Ck. C. G., 4200', 25 June 2002, A. D. Warren, 1♂ (ADW); Blue Mts., Hwy. 244, ca. 2 mi. SE Lane Ck. C. G., ca. 4300', 25 June 2002, A. D. Warren, 3♂ 2♀ (ADW); Blue Mts., Rd. 020 at Frazier Ck. C. G. 4400', 25 June 2002, A. D. Warren, 3♂ 2♀ (ADW); **Union County:** Marley Ck. Lane (NFD 2442), ca. 2 mi. SW Starkey on Hwy. 244, 25 June 2002, A. D. Warren, 1♂ (ADW); Phillips Cyn., ca. 2 mi. W. Elgin, ca. 3000', 23 June 2002, A. D. Warren, 1♀ (ADW); Wallowa Mts., North Fork Catherine Creek, NFD 7785, ca. 3 mi. E. Medical Springs Hwy. (203), 22 June 2002, A. D. Warren, 2♂ (ADW); **Wallowa County:** Blue Mts., Powhatka Ridge, ca. 11 mi. N. of Wallowa on Troy Rd., 4100', 23 June 2002, A. D. Warren, 8♂ 11♀ (ADW); Minam, along Wallowa River, 2900', 23 June 2002, A. D. Warren, 9♂ (ADW); Wallowa Mts., Gumboot Ck., vic. jct. Imnaha River on Rd. 39, 3900', 24 June 2002, A. D. Warren, 2♂ (ADW); Wallowa Mts., Salt Creek Summit Rec. Site, NFD 3915, 6000', 24 June 2002, A. D. Warren, 1♂ (ADW).

**Additional Records:** The following specimens are listed here because they occur in association with a variety of *Eriogonum heracleoides* other than *Er. heracleoides* var. *heracleoides*, because there may be doubt about food plant associations, and/or because they were considered to represent another taxon in publications on the genus by Shields (e.g., 1975). Many museum specimens labeled without specific food plant association information fall into the latter two categories. **CANADA: BRITISH COLUMBIA:** Oliver, 3 June 1933, J. McDunnough, 1♀ (MGCL); same locality, 15 June 1978, 1♂ (MGCL); Penticon, 4 May 1978, 2♂ (MGCL); same locality, May 1978, K. Thorne, 2♂ (MGCL); same locality, May 1979, K. Thorne, 1♂ (MGCL); same locality, June 1978, K. Thorne, 1♀ (MGCL); Princeton, 26 June [??], B. Weber, 3♂ 3♀ (MGCL); Shingle Ck. Rd., Keremos, 19 June 1933, A. N. Gartrell, 1♂ (MGCL); Summerland, May 1978, 1♀ (MGCL); same locality, May 1979, 2♂ 1♀ (MGCL); same locality, 6 June 1986, 1♂ (MGCL); 3 km N. of Grand Forks, assoc. *Er. heracleoides*, 3 June 2003, N. Kondla, 19♂ 10♀ (ADW); **USA: IDAHO: Boise County:** Arrowrock Dam, 15 May [??], 1♂ (MGCL); Banks NF Campground, off SR-55, nr. Payette River, 2800', 26 June 1990, D. L. Eiler, 1♂ 1♀ (MGCL); Cottonwood Canyon, 30 May [??], J. H. Manning, 2♂ (MGCL); Deep Park, 4200', N. Fork Boise River, [no date], J. H. Manning, 1♂ (MGCL); Grimes Ck. Cyn., 2 mi. upstream ID Hwy. 21, 12 June 1989, L. D. Beutler, 2♂ (ADW); nr. Boise, 2700', [no date], J. H. Manning, 3♂ (MGCL); road by Arrow Rock Reservoir just above Arrow Rock Dam, 12 June 1988, D. ***Euphilotes baueri baueri*** (Shields, 1975)  
(Figs. 61-64, 261-262, 332)

*Shijimiaeoides battoides baueri* Shields, 1975, Bull. Allyn Mus. (28): 15-16.

*Euphilotes battoides baueri* (Shields); Miller & Brown, 1981, Mem. Lepid. Soc. (2): 118; Mattoni, 1989, J. Res. Lepid. 27(3/4): 175.

*Euphilotes baueri* (Shields, 1975); Pratt & J. Emmel, 1998, Syst. W. N. Am. Butterflies (16): 220.

*Euphilotes baueri baueri* (Shields, 1975); Pelham, 2008, J. Res. Lepid. 40: 249; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** California: Inyo County; W. side Gilbert Pass, 6200'.

Pratt & Emmel (1998) considered *E. baueri* a species distinct from *E. battoides*. Male genitalia of *E. baueri* are typical of the *battoides* complex, with bifurcate valvae (Figs. 261-262). The female is typical for the complex as well, with a ring-shaped lodix, but the antrum is much shorter than in other members of the complex (Fig. 332). *Euphilotes b. baueri* flies mainly from mid-May to early June, and the larval food plant is *Eriogonum ovalifolium* var. *ovalifolium*. The most prominent distinguishing characteristic of *E. b. baueri* is the large amount of blue on the dorsal wing surfaces of females (Fig. 63). The distribution of *E. b. baueri* includes northeastern to east-central California and west-central Nevada (Fig. 385).

***Euphilotes baueri vernalis*** Pratt & J. Emmel, 1998  
(Figs. 65-68)

*Euphilotes battoides vernalis* Pratt & J. Emmel, 1998, Syst. N. Am. Butts. (16): 221.

*Euphilotes baueri vernalis* Pratt & J. Emmel; Davenport, 2004a, Tax. Rept. Int. Lepid. Surv. 4(7): 10.

*Euphilotes battoides vernalis* Pratt & J. Emmel, 1998; Pelham, 2008, J. Res. Lepid. 40: 247.

*Euphilotes baueri vernalis* Pratt & J. Emmel, 1998; Pelham, 2021, Cat. Butterflies U.S. Can.

<http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** California: San Bernardino County; Coxey Meadow, 1600m.

*Euphilotes b. vernalis* was described as a subspecies of *E. battoides* (Pratt & Emmel, 1998), but Davenport (2004a) aligned it with *E. baueri*, citing comments by Gordon Pratt, as reason for the change. Pratt & Emmel (1998) cited *Eriogonum kennedyi* var. *kennedyi*, a close relative of *Er. ovalifolium*, as the larval food plant. Females have significant blue dorsally, and adults usually fly in April. *Euphilotes b. vernalis* is apparently endemic to the northwestern slopes of the San Bernardino Mountains, in San Bernardino County, California (Fig. 385).

***Euphilotes baueri orientis* Austin, 1998**  
(Figs. 69-72, 263, 333)

*Euphilotes baueri orientis* Austin, 1998, Syst. W. N. Am. Butts. (45): 550-551; Pelham, 2008, J. Res. Lepid. 40: 249; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Nevada: Lincoln County; Bristol Mountains, U. S. Highway 93, 12.5 road miles north of Pioche, 1826m, T3N R66E (unsectioned) on USGS Bristol Range SE, Nev., 7.5' quadrangle.

Austin (1998) discussed the differences between *E. b. baueri* and the more eastern populations which he named *E. b. orientis*, as follows. *Euphilotes b. orientis* males are slightly more purplish than those of *E. b. baueri*, have broader dark margins on the forewing, and have more marginal black on the hindwing. Females of *E. b. orientis* have much less blue dorsally and have a narrower aurora on average. The ventral wings of both sexes of *E. b. orientis* have larger macules and narrower aurorae than do *E. b. baueri*. The larval food plant is *Eriogonum ovalifolium*. The distribution, given in the original description, is central and southeastern Nevada, southwestern Utah, and northwestern Arizona (Fig. 385).

***Euphilotes baueri* (Shields, 1975) (far N. Great Basin northward segregate)**  
(Figs. 73-78, 264-266, 334-335)

Warren et al., 2016, Illustrated lists of American butterflies, Revised 21 Nov. 2017, Accessed 19 Feb., 2021, <http://www.butterfliesofamerica.com>.

Warren (2005) considered all populations of *Euphilotes* in Oregon that use *Eriogonum ovalifolium* var. *ovalifolium* as the larval food plant conspecific with *E. baueri*, mainly because of their food plant association. He discussed populations in two regions of Oregon, the Alvord Desert of Harney County and the Crook-Deschutes County line area east of Redmond. In Crook and Deschutes counties, adults of *E. baueri* closely resemble those of parapatric populations of *E. g. glaucon* associated with *Er. umbellatum*, but males average somewhat paler blue. In southeastern Oregon, most individuals of *E. baueri* generally resemble *E. b. orientis*, and further study may suggest that the name *E. b. orientis* applies to them.

Populations of the *E. battoides* complex occurring in the central Columbia Basin that fly in early May (vic. Richland, Benton Co., Washington; vic. Hermiston, Morrow Co., Oregon), might represent *E. baueri*, but food plant associations have not been verified, and these have not been mapped herein (Fig. 385). Additional unassociated *Euphilotes* populations in Washington are known to feed on *Eriogonum sphaerocephalum* Douglas ex Benth., as detailed by James & Nunnallee (2011). Whether or not these

populations should be aligned with *E. baueri*, or another member of the *E. battoides* complex in the region, remains unclear. For now, none of these populations have been included in our distribution map for *E. baueri* (Fig. 385).

**Specimens Examined:** USA: NEVADA: Humboldt County: Bloody Run Hills, SW facing slopes along Sand Pass Rd., 5100', 0.1-1.4 mi. W. of Sand Pass Summit, 4.7 mi. W. jct. Hwy. 95, N. of Winnemucca, 18 May 2016, assoc. *Er. ovalifolium*, R. L. Romeyn, 2♂ (SK); OREGON: Crook County: Hwy. 126, 0.5-1.5 mi. E. ### *Euphilotes baueri borealis* Kohler – new subspecies (Figs. 79-94, 267-269, 336-338)

ZooBank registration: [urn:lsid:zoobank.org:act:6D9C6062-C226-46B1-B391-6E71AA8FC7B6](http://urn:lsid:zoobank.org:act:6D9C6062-C226-46B1-B391-6E71AA8FC7B6)

As early as 2000, Kohler found what appeared to be two different species of *Euphilotes* in the *E. battoides* complex occurring at the same locality in Sanders County, Montana. The area has an extensive stand of *Eriogonum ovalifolium*, but also a considerable amount of *Er. heracleoides*. The first *Euphilotes* species, *E. baueri borealis*, begins to fly when the *Er. ovalifolium* is in the full pre-bloom stage, which typically occurs in early May. The *Er. heracleoides* in the same area blooms about one month later, in early to mid-June, and the second *E. battoides* complex species, *E. heracleoides*, (described above) is associated with it.

**Definition:** Like *E. b. orientis*, males of *E. b. borealis* are a darker shade of blue dorsally than those of *E. b. baueri*, but the black wing borders of *E. b. borealis* males average somewhat wider than those of *E. b. orientis*. Dorsally, females of *E. b. borealis* are dark brown with dark orange aurorae, and have no or at most a hint of blue coloration. Ventrally, both sexes of *E. b. borealis* are similar to the other described subspecies of *E. baueri*, having very large macules on the forewings, which appear smudged along the posterior margin and in the tornus. There is also considerable dark suffusion in the basal areas of both forewings and hindwings of *E. b. borealis*. The male genitalia of *E. b. borealis* are similar to other described subspecies of *E. baueri* and other members of the *E. battoides* complex, in having bifurcate valvae (Figs. 267-269). The female genitalia are typical of other described subspecies of *E. baueri* in having a lodix with a short antrum and surrounding lamella (Figs. 336-338).

**Etymology:** The name of this subspecies, *borealis* means “northern” or pertaining to the north wind”, and denotes the northern most known population of *Euphilotes baueri*.

**Distribution and Phenology:** To date, *E. baueri borealis* is known from only three localities in Montana (Fig. 385). A large population exists in the area of the type locality, the main portion of which is a full section of State of Montana-owned land leased for grazing purposes, between the town of Camas Prairie and Markle Pass, 2 miles to the north. An extensive stand of *Eriogonum ovalifolium* Nutt. var. *pansum* Reveal, the presumed larval food plant, covers a large portion of the section and is especially prevalent in the shallow rocky soil along the tops of several low ridges that cross the section (Fig. 376). The single brood of the adult butterflies begins to fly when the buckwheat is in the full pre-bloom stage, which

usually occurs the first part of May. Also occurring in the same area is *Eriogonum heracleoides* var. *heracleoides*, which blooms about one month later, in early to mid-June. *Euphilotes heracleoides* is associated with it. Even though *E. b. borealis* and *E. heracleoides* are present in the same area, *E. b. borealis* is basically finished flying before *E. heracleoides* start to emerge. Recently, a second population of *E. b. borealis* was discovered a few miles to the northeast of the type locality, but few adults have been obtained. In 2016, an additional population was discovered in the area of Twin Bridges, Madison County, east of the Continental Divide, about 180 miles southeast of the type locality. This site is higher in elevation, 5375', compared to 2960' at the type locality. At the Madison County locality, the adult flight occurred around mid-June in 2016 and 2017. The presumed food plant at this locality is *Eriogonum ovalifolium* var. *ovalifolium*, and was the only species of *Eriogonum* present. Despite being widely distributed in much of the western two-thirds of Montana, searches of *Er. ovalifolium* have not resulted in the discovery of any additional *E. baueri* populations. At one locality in Lewis and Clark County where stands of *Er. ovalifolium* occur at 7000' elevation, the *Euphilotes* that were associated with it turned out to be *E. ancilla* (discussed below).

**Types:** Holotype male: **MONTANA: Saunders County:** 4.5mi N of Camas Prairie, 5 May 2004, S. Kohler Collector (47.53086, -114.60782). Allotype female: **MONTANA: Sanders County:** 4.5 mi N of Camas Prairie, 6 May 2004, S. Kohler Collector. Paratypes: **MONTANA: Sanders County:** 5 mi. N. Camas Prairie, 20 May 1997, S. Kohler, 20♂ 33♀ (SK); 4.5 mi. N. Camas Prairie, 20 May 1997, S. Kohler, 40♂ 23♀ (SK); same locality, 5 May 1998, S. Kohler, 24♂ 15♀ (SK); same locality, 6 May 1998, S. Kohler, 77♂ 64♀ (SK); same locality, 7 May 1998, S. Kohler, 17♂ 7♀ (SK); same locality, 15 May 1998, S. Kohler, 1♂ 1♀ (SK); same locality, 5 May 2004, S. Kohler, 65♂ 46♀ (SK); same locality, 6 May 2004, S. Kohler, 109♂ 42♀ (SK); same locality, 17 May 2006, S. Kohler, 1♀ (SK); 4.5 mi. north Camas Prairie, west Hwy. 382, 2945', 4 May 2016, S. Kohler, 36♂ 18♀ (SK); same locality, 2950', 13 May 2016, S. Kohler, 3♂ 5♀ (SK); same locality, 15 May 2018, S. Kohler, 13♂ 5♀ (SK); 1 mi. S. of Markle Pass, 24 May 1999, S. Kohler, 3♂ 4♀ (SK). All associated with *Eriogonum ovalifolium* var. *pansum*.

**Deposition of Types:** The holotype male, allotype female and four male and four female paratypes will be deposited in the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida. The remaining paratypes are in the Kohler Collection.

**Type Locality:** USA: Montana: Sanders County: west of Highway 382, 4.5 miles north of Camas Prairie, 2950' (Fig. 376, upper).

**Additional Specimens Examined:** USA: **MONTANA: Madison County:** Melrose Bench Rd., 5375', 6 mi. W. Twin Bridges, 22 June 2016, assoc. *Eriogonum ovalifolium* var. *ovalifolium*, S. Kohler, 5♂ 4♀ (SK); Melrose Bench Rd., 5400', 15 mi. SE of Melrose, 6 June 2017, assoc. *Er. ovalifolium* var. *ovalifolium*, S. Kohler, 21♂ 18♀ (SK); **Sanders County:** Wilks Gulch Road, 2790', SE of Hot Springs, 13 May 2016, assoc. *Er. ovalifolium* var. *pansum*, S. Kohler, 1♂ (SK).

### *Euphilotes baueri shoshone* Kohler – new subspecies (Figs. 95-106, 270-271, 339-340)

ZooBank registration: [urn:lsid:zoobank.org:act:7E804961-6B1A-4B14-8066-5F3E7A833FD9](http://urn:lsid:zoobank.org:act:7E804961-6B1A-4B14-8066-5F3E7A833FD9)

Prior to 2017, *Euphilotes baueri* had not yet been confirmed to fly in Idaho, despite appropriate environmental factors and the presence of *Eriogonum ovalifolium*. In 2017, we began a study with the goal of locating Idaho populations of *E. baueri* and assessing their characteristics. Richard L. Romeyn facilitated obtaining the required permit, coordinating with Todd C. Stefanic, Wildlife Biologist with Craters of the Moon National Monument. On May 30-June 2, 2017, Kohler was able to obtain a sufficient study series of *Euphilotes* from the area. It represents a population isolated from adjacent populations to the north, west and south.

**Definition:** *Euphilotes b. shoshone* males are the darkest of any of the described subspecies of *E. baueri*, being a more purplish-blue than the others, with wide black wing margins. The orange of the dorsal

hindwing aurora is variable, being absent, or at most, consisting of two or three lunules in the tornus area. Ventrally, the wing surfaces of both sexes are typical of other described subspecies of *E. baueri*, with the large forewing macules and the smudged appearance along the posterior margin and the tornus somewhat more noticeable. Male genitalia (Figs. 270-271) are typical for *E. baueri*, with bifurcate valvae. The female genitalia are also consistent with *E. baueri*, having a lodix with a short antrum and surrounding lamella (Figs. 339-340).

**Etymology:** Members of the Shoshone and Bannock tribes and their ancestors had the most contact among native inhabitants with the lava fields of Craters of the Moon. Extensive archaeological evidence suggests the Shoshone and Bannock frequently visited Craters of the Moon in the vicinity of today's loop drive and Highways 20, 26 and 93. The Shoshone were a branch of the Northern Shoshone that inhabited the upper Columbia River Basin, while the Bannock were a branch of the Northern Paiute. These two groups both occupied the Snake River Plain, intermingled, traveled and hunted together, and otherwise coexisted while speaking slightly different languages. The Shoshone and Bannock did not live in large, highly-structured tribes with identified chiefs. Instead they tended to spread out into small, semi-nomadic groups or bands of two or three families in summer, searching for food throughout the plain and into the mountain valleys (National Park Service, 2020).

**Distribution and Phenology:** This subspecies has been found only at Craters of the Moon National Monument, Butte County, Idaho (Fig. 385). The larval food plant, *Eriogonum ovalifolium* var. *focarium* Reveal & Mansfield (Craters-of-the-Moon wild buckwheat), is endemic to the Monument (Fig. 377), flowering from May-August in black volcanic cinder flats and slopes in sagebrush communities and conifer woodlands (Reveal & Mansfield, 2014). In our 2017 sampling, adults were flying from late May through early June.

**Types:** Holotype male: **IDAHO: Butte County:** NE jct. Craters Loop Rd. & Tree Molds Rd., 5875', Craters of the Moon Nat. Mon., 1 June 2017, S Kohler Collector (43.44107, -113.54249). Allotype female: same data as holotype. Paratypes: same data as holotype, 23♂ 10♀; **IDAHO: Butte County:** Crater Loop Drive, 2.5 mi. S. Visitor Center, 5975', Craters of the Moon Nat. Mon., 30-31 May 2017, S. Kohler, 22♂ 11♀; NE jct. Craters Loop Rd. & Tree Molds Rd., 5900', Craters of the Moon Nat. Mon., 2 June 2017, S. Kohler, 11♂ 17♀.

**Deposition of Types:** The holotype male, allotype female and the majority of the paratypes will be deposited in the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida. The remaining paratypes are in the Kohler Collection.

**Type Locality:** USA: IDAHO: Butte County: vicinity of Crater Loop Road, 5875-5975', Craters of the Moon National Monument (Fig. 377, upper and lower).

## THE *EUPHILOTES ENOPTES* COMPLEX

Pelham (2021) included the following species in the *Euphilotes enoptes* complex: *E. ancilla* (W. Barnes & McDunnough) (Figs. 292-302), *E. stanfordorum* Opler & A. Warren, *E. mojave* (F. Watson & W. Comstock), *E. enoptes* (Boisduval) (Figs. 303-307), *E. dammersi* (J. A. Comstock & Henne), and *E. columbiae* (Mattoni) (Figs. 308-309). In this species complex, the male genitalia have valvae that are, when viewed laterally, broad, simple and flat, curving upward distally, the broad distal margin being furnished with a row of small teeth ending ventrally in a single strong spine below which is a rather deep excavation (Fig. 303-306). In the female genitalia, the lodix is large and exposed, with the lamellae surrounding the ostium bursae and antrum cylindrical in shape, with the lamella postvaginalis extending well posterior of the ostium bursae. The lodix reaches its greatest development in *E. enoptes* (Figs. 366-367) and *E. columbiae* (Figs. 368-369).

***Euphilotes oakleyi* Kohler – new species**

(Figs. 107-140, 273-291, 341-351)

***Euphilotes oakleyi oakleyi* Kohler**

(Figs. 107-124, 273-282, 341-343)

ZooBank registration: <urn:lsid:zoobank.org:act:7884CBB3-3789-4491-8880-785488B6BF17>

Shields (1975) stated, “a hybrid specimen of *battoides glaucon* X *enoptes ancilla* has come to my attention, a male from Pattee Canyon, 3500’, Missoula Co., Montana, VI-23-62 (J. Scott). Face on, the left valve is like *battoides* and the right valve (though somewhat shorter) is like *enoptes*! Also, two males from 8 mi. N. of Jarbidge, Elko Co., Nevada, VI-28-67 (J. Lane) appear to have somewhat intermediate genitalia between *battoides glaucon* and *enoptes ancilla* (*i.e.*, both have bifurcate valvae but not as deeply as is usual in *battoides*, and one has prominent teeth in a row, as in *enoptes*, along the concave surface). Thus it would appear likely that these three specimens are hybrids between *b. glaucon* and *e. ancilla*, two subspecies that are nearly identical in adult facies and which utilize the same hosts, *Eriogonum umbellatum* and *Er. heracleoides*.” Shields (1977) also stated, “Ssp. *ancilla* approaches the range of *battoides glaucon* in western Nevada, at Pyramid Lake and Silver City. In Elko Co., Nevada, the two nearly overlap in range, *glaucon* occurring north of Jarbidge on the Nevada-Idaho border and *ancilla* flying in the Jarbidge Mts. at Pine Creek near Jarbidge, Jarbidge, 3 mi. S. Jarbidge and Bonanza Gulch. Based on genitalia, two specimens from 8 mi. N. of Jarbidge, appear to be hybrids between the two.” He also provided SEM photos of the valva of two of the three specimens, one from Montana and one from Nevada, as Figs. 32-35, pp. 62-65 (Shields, 1977).

In 2001, John Christenson, Megan Hansen and Will Kerling collected a male *Euphilotes* in the Rattlesnake Recreation Area (Spring Gulch) north of Missoula, Missoula Co., Montana. John Christensen performed a genitalic dissection and made a microscope slide of the valva, subsequently showing it to Kohler, and commenting that it could possibly be a new species, since it matched neither the *E. enoptes* nor *E. battoides* complex. Kohler recognized the similarity of the configuration of the valva to the figures of the supposed hybrids in Shields (1977), and the following year (2002), obtained a sufficient study series of males from the area. After performing multiple genitalia dissections, each resembling the Shields photos, it became obvious that we were indeed dealing with a distinct new species. Kerling was also able to document the food plant association further up the drainage (Stuart Peak Trail) in 2002 by collecting adults of both sexes on *Eriogonum umbellatum*. In 2003, Kohler collected a series of males and females on *Er. umbellatum* at the same locality. Since then, populations of this species have been found at several more localities, as detailed below.

**Definition:** Overall aspects of male and female genitalia seem to place this species in the *Euphilotes enoptes* complex, being nearer in appearance to that group, but clearly intermediate towards the *E. battoides* complex, with the extended upper prong of the valva, but not to the extent of the bifurcate valva of members of the *E. battoides* complex. The lodix of the female genitalia is moderately large and exposed. Adults of this species are much like western Montana populations of *Euphilotes ancilla* (discussed below) in appearance and phenology, and because both use *Er. umbellatum* as a food plant, the only reliable method of identification is by examination of the genitalia. In male *E. ancilla*, the terminal margin of the cucullus of the valva forms a rather straight line with many fine teeth (Figs. 292-297). In male *E. oakleyi*, the dorsal portion of the cucullus of the valva is elongated into a curved prong extending caudally, and when teeth are present along the terminal margin, they are fewer in number and larger (Figs. 273-282). In female *E. ancilla*, the shape of the lodix is typical of the *E. enoptes* complex, with the lamella postvaginalis being large and fully developed and extending caudally well beyond the ostium bursae (Figs. 352-354). In female *E. oakleyi*, the central portion of the lamella postvaginalis still extends caudally, but the peripheral portions on either side are somewhat reduced (Figs. 341-343).

**Etymology:** This species is named for Oakley Shields, a pioneer in the modern study of the genus *Euphilotes*, and the first to illustrate the distinctive valva of the male genitalia of *E. oakleyi*, though he

considered that the specimens he figured were hybrids, and did not recognize *E. oakleyi* as a distinct species.

**Distribution and Phenology:** To date, records indicate a rather limited distribution for *E. oakleyi*, primarily in western Montana (Fig. 386). Recent field work has expanded our knowledge of its distribution and underscores the importance of genitalic examination of all specimens encountered. The record for Elko Co., Nevada, leaves open the possibility that this species is much more widespread over a large geographic expanse between Montana and Nevada, but has thus far gone undetected in this intervening area. Most of the specimens from Montana were taken in association with *Er. umbellatum* (Fig. 378, upper right and lower). The flight period for the single brood is June and July, depending on seasonal development and elevation.

**Types:** Holotype male: **MONTANA: Missoula County:** Stuart Peak Trail, Rattlesnake Mtns., 18 June 2003, S. Kohler Collector (46.98790, -113.94785). Allotype female: same data as holotype. Paratypes:

**MONTANA: Missoula County:** Stuart Peak Trail, Rattlesnake Mts., 18 June 2003, S. Kohler, 13♂ 9♀; same locality, 4 July 2006, S. Kohler, 6♂ 4♀; same locality, 16 July 2002, W. Kerling, 2♂ 6♀; Spring Gulch, Rattlesnake Mountains, 25 June 2002, W. Kerling, 1♂; same locality, 6 July 2002, S. Kohler, 35♂; same locality, 9 July 2002, S. Kohler, 2♂; same locality, 16 July 2002, S. Kohler, 2♂; same locality, 28 June 2007, A.D. Warren, 12♂; same locality, 28 June 2007, S. Kohler, 3♂ 1♀; same locality, 5360', 28 June 2004, S. Kohler, 1♂.

**Deposition of Types:** The holotype male, allotype female and three male and three female paratypes will be deposited in the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida. The remaining paratypes are in the Kohler Collection and in ADW research material.

**Type Locality:** USA: MONTANA: Missoula County: vicinity of Spring Gulch and Stuart Peak Trail, 4.5 miles up, Rattlesnake Mountains, north of Missoula (Fig. 378, lower).

**Additional Specimens Examined:** USA: **MONTANA: Deer Lodge County:** Dry Cottonwood Creek, 6 mi. E. of Galen, 19 June 2007, S. Kohler, 4♂ (SK); **Jefferson County:** Warm Springs Creek, east of Alhambra, 23 June 2005, S. Kohler, 4♂ (SK); **Missoula County:** Miller Cr., 1 July 1975, S. Kohler, 1♂ (SK); 6 mi. up Rattlesnake Cr., 12 July 1999, W. Kerling, 1♂ (SK); Rattlesnake Rec. Area, 7 July 2001, M. Hanson, 1♂ (SK); Mount Jumbo, 14 June 2003, W. Kerling, 2♂ (SK); N. end Mount Jumbo, NE of Missoula, 16 June 2004, W. Kerling, 1♂ (SK); same locality, 20 June 2004, W. Kerling, 1♂ (SK); Mt. Baldy #361, MPG Ranch, 10 June 2015, J. S. Pippen, 2♂ 1♀ (SK); Mount Baldy, MPG Ranch, 2 July 2014, assoc. *Er. umbellatum*, J. S. Pippen, 1♀ (SK); Whaley Pond, MPG Ranch, 22 May 2015, J. S. Pippen, 1♂ (SK); Whaley Draw, MPG Ranch, 4 June 2014, J. S. Pippen, 1♂ (SK); same locality, 15 June 2015, J. S. Pippen, 1♂ (SK); **Ravalli County:** Bass Cr., Florence, 3 July 1976, S. Kohler, 1♂ (SK); same locality, 17 June 1980, S. Kohler, 1♂ (SK); same locality, 21 July 1980, S. Kohler, 3♂ (SK); same locality, 13 June 1982, S. Kohler, 1♂ (SK); same locality, 8 July 1985, S. Kohler, 1♂ (SK); mouth 3-Mile Cr., 4000', SE of Florence, 4 June 2018, 7♂ (SK); 3-Mile Cr. Rd., 5 mi. up, 4850', SE of Florence, 4 June 2018, S. Kohler, 2♂ (SK); 8-Mile Creek, E. of Florence, 26 June 1982, S. Kohler, 1♂ (SK); **Silver Bow County:** Rocky Ridge Trailhead, Divide Cr., 3 mi. W. Feely, 18 June 2001, S. Kohler, 2♀ (SK); same locality, 22 June 2001, S. Kohler, 10♂ 8♀ (SK); same locality, 30 June 2007, S. Kohler, 1♀ (SK); Rocky Ridge Trailhead, W. of Feely, 30 June 2005, S. Kohler, 4♂ (SK); Rocky Ridge Trailhead, 2.5 mi. west Feely, Divide Cr., 16 June 2003, S. Kohler, 5♂ 1♀ (SK); same locality, 19 June 2003, S. Kohler, 26♂ 12♀ (SK); Rocky Ridge Trailhead, 5900', Divide Cr., 2.5 mi. west Feely exit I-15, 21 June 2007, S. Kohler, 18♂ 2♀ (SK); same locality, 14 June 2012, S. Kohler, 13♂ (SK).

**Additional Records:** The following records were given by Shields (1977) and treated as possible hybrids between *Shijimiaeoides enoptes ancilla* and *S. battooides glaucon*. **USA: MONTANA: Missoula County:** Pattee Canyon, 3500', 23 June 1962, J. A. Scott, 1♂; **NEVADA: Elko County:** 8 mi. N. of Jarbridge, 28 June 1967, J. Lane, 2♂. SEM photos of the male genitalia of two of these specimens were given by Shields (1977, Figs. 32-35). Though Shields considered these were possible hybrids, the figures clearly show the configuration of the valve as being consistent with what we now recognize as characteristic of *Euphilotes oakleyi*.

***Euphilotes oakleyi madisonensis* Kohler – new subspecies**

(Figs. 125-140, 283-291, 344-351)

ZooBank registration: <urn:lsid:zoobank.org:act:5C9B18DF-9B4C-453F-AB0C-FBE381F0E3EC>

A population of *Euphilotes* discovered in 2008, displaying the same general configuration of male and female genitalia as *E. oakleyi*, but isolated geographically from it, and utilizing a larval food plant different than *Eriogonum umbellatum*, warrants subspecific status.

**Definition:** The appearance of the wing surfaces of both sexes of *E. oakleyi madisonensis* is similar to those of *E. o. oakleyi*, except that males of *madisonensis* are a lighter shade of blue dorsally. However, the two subspecies differ considerably in details of the genitalia of both sexes. The curved prong of the dorsal cucullus of the valva of male *E. o. madisonensis* is more pronounced and elongated (Figs. 283-291) than in *E. o. oakleyi* (Figs. 273-282, in many individuals approaching in superficial appearance the shape of valvae of the *E. battoides* complex, except that the spine-like process on the inner surface of the valva at the junction of the upper prong with the lower portion of the valva of the *E. battoides* complex is not present on *E. o. madisonensis*. The conformation of the lodix of *E. o. madisonensis* also differs substantially from that of *E. o. oakleyi*. The lamella postvaginalis is much reduced on *E. o. madisonensis*, leaving only shoulder-like lateral projections with the central portion being narrow and much reduced (Figs. 344-351). These aspects of the genitalia of *E. o. madisonensis* place it even more intermediate between the *E. enoptes* and *E. battoides* complexes than *E. o. oakleyi*, at least in superficial appearance.

**Etymology:** This subspecies is named for the river valley and county in which the population was discovered, Madison River Valley, Madison County, Montana.

**Distribution and Phenology:** This subspecies has thus far been found at only a few localities in southwestern Montana (Fig 386). At the type locality, the associated food plant, *Eriogonum ovalifolium* var. *ovalifolium* grows in scattered patches over a large grassland area on the bench east of the Madison River (Fig. 379, upper left). Flight period of adults of the single brood is from mid-June through early July.

**Types:** Holotype male: **MONTANA: Madison County:** Varney Road, 4 mi NW of Cameron, 27 June 2013, 5345', S. Kohler Collector (45.22658, -111.72227). Allotype female: same data as holotype. Paratypes: **MONTANA: Madison County:** Varney Road, 4 mi. NW Cameron, 7 July 2008, S. Kohler, 1♂ 2♀; same locality, 30 June 2009, S. Kohler, 1♂ 9♀; same locality, 23 June 2010, S. Kohler, 20♂ 12♀; same locality, 24 June 2010, S. Kohler, 15♂ 7♀; Varney Road, 5315' 4 mi. NW Cameron, 1 July 2011, S. Kohler, 22♂ 44♀; Varney Road, 5345', 4 mi. NW Cameron, 21 June 2012, S. Kohler, 1♂ 13♀; same locality, 27 June 2013, S. Kohler, 25♂ 56♀; same locality, 28 June 2013, S. Kohler, 47♂ 61♀; Varney Road, 5300', 4 mi. NW Cameron, 17 June 2016, S. Kohler, 23♂ 28♀.

**Deposition of Types:** The holotype male, allotype female and four male and four female paratypes will be deposited in the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida. The remaining paratypes are in the Kohler Collection.

**Type Locality:** USA: MONTANA: Madison County: state section, Varney Road, 5300-5345', 4 miles NW Cameron.

**Additional Specimens Examined:** **Madison County:** S. of Camp Creek Rd., 2 mi. E. of Melrose, 30 June 2007, S. Kohler, 1♂ (SK); Gravelly Range Rd., 7300', N. Nat. For. boundary, 30 June 2015, S. Kohler, 1♂ (SK); Tobacco Root Mountains, S. Willow Ck., ca. 8.0 rd. mi. SW jct. Norwegian Creek Rd., 6600', 30 June 2007, A.D. Warren (at mud but ID'd by genitalia), 3♂ (ADW); **Silver Bow County:** Soap Gulch, 6980', 7 mi. up, NE Melrose, 15 June 2015, S. Kohler, 3♂ (SK); Soap Gulch, 6850-7150', 7-8 mi. up, NE Melrose, 17 June 2015, S. Kohler, 30♂ (SK); Soap Gulch, 6900', 6 mi. up, NE Melrose, 23 June 2016, S. Kohler, 3♂ (SK); Soap Gulch, 6875-7300', 6-7 mi. up, NE Melrose, 24 June 2015, S. Kohler, 20♂ (SK); Soap Gulch, 6850-7300', 6-7 mi. up, NE Melrose, 25 June 2015, S. Kohler, 8♂ (SK); Soap Gulch, 7300', 7 mi. up, NE Melrose, 3 July 2020, S. Kohler, 6♂ (SK); Soap Gulch, NE of Melrose, 15 July 2011, S. Kohler, 9♂ (SK); Soap Gulch, 3-6 mi. up, NE of Melrose, 22 July 2010, S. Kohler, 30♂ (SK); Soap Gulch, 6-8 mi. up, NE of Melrose, 20 July 2010, S. Kohler, 10♂ 2♀ (SK); Soap Gulch, 6 mi. up, NE of Melrose, 24 July 2010, 9♂ 1♀ (SK); Soap Gulch, 3-6 mi. up, NE of Melrose, 3 August 2010, S. Kohler, 2♂ (SK).

***Euphilotes ancilla ancilla*** (W. Barnes & McDunnough, 1918)  
(Figs. 141-146, 292, 352)

[*Philotes enoptes*] *ancilla* W. Barnes & McDunnough, 1918, Contrib. Nat. Hist. Lepid. N. Am. 4(2):79.

*Philotes enoptes ancilla* B. & McD; McDunnough, 1938, Mem. S. Calif. Acad. Sci. 1: 28.

*Philotes enoptes ancilla* Barnes & McDunnough, 1918; dos Passos, 1964, Mem. Lepid. Soc. (1): 67; Langston, 1969, J. Lepid. Soc. 23(1): 51.

*Shijimaeoides enoptes ancilla* (Barnes & McDunnough, 1918); Shields, 1977, J. Res. Lepid. 16(1):11.

*Euphilotes enoptes ancilla* (Barnes and McDunnough); Miller & Brown, 1981, Mem. Lepid. Soc. (2): 118.

*Euphilotes ancilla ancilla* (Barnes & McDunnough, 1918); Pratt & Emmel, 1998, Syst. W. N. Am. Butts. (16): 213; Pelham, 2008, J. Res. Lepid. 40: 250; Pelham, 2021, Cat. Butterflies U.S. Can. <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Utah: [Juab County]; Eureka.

Pratt & Emmel (1998) and Warren (2005) treated *Euphilotes ancilla* as a species level taxon. Pratt & Emmel (1998) considered *Euphilotes a. ancilla* to occupy an extremely wide range (Fig. 387), although populations along Colorado's Front Range have since been described as a separate subspecies (see below). *E. a. ancilla* resembles *E. g. glaucon* in the appearance of the adults, differing mainly in the conformation of the genitalia. Throughout its range, *E. a. ancilla* is mainly associated with *Eriogonum umbellatum*, although it uses *Er. heracleoides* in parts of northern Nevada.

Further study of *E. a. ancilla* populations is needed to determine if additional subspecies-level taxa are represented within its broad distribution. For now, all material from western Colorado, as well as populations in southern Wyoming which utilize *Er. umbellatum* var. *majus* (Hook.) (= *Er. subalpinum* Greene) as a larval food plant are included within the concept of *E. a. ancilla*, although these populations may be somewhat intermediate between *E. a. ancilla* and *E. a. barnesi*. These southern Rocky Mountain populations will be treated in more detail by the authors in a subsequent publication, where data from western Colorado and southern Wyoming will be provided.

**Specimens Examined:** USA: IDAHO: Caribou County: Wood Canyon, 6533', 25 June 1995, V. Covlin, 1♂ (ADW); Lemhi County: (all ADW coll., all taken at mud); W. side Bitterroot Range, Cow Ck., 5520', off Lemhi Pass Rd., E. of Tendoy, 16 July 2005, T.W. Ortenburger, 4♂; same locality, 16 July 2006, T.W. Ortenburger, 1♂; same locality, 18 July 2006, T.W. Ortenburger, 1♂ 1♀; same locality, 22 July 2006, T.W. Ortenburger, 2♂ 1♀; W. side Bitterroot Range, upper Cow Creek Rd. fork, off Lemhi Pass Rd., E. of Tendoy, 6205', 18 July 2006, T.W. Ortenburger, 1♂; W. side Bitterroot Range, Lake Yearian Ck. Drainage ENE of Lemhi, 6327', 18 July 2006, T.W. Ortenburger, 11♂; same locality, 22 July 2006, T.W. Ortenburger, 2♂; W. side Bitterroot Range, Pallee Ck. Rd., NE of Tendoy, sandbar below 3-way-junction, 5141', 16 July 2006, T.W. Ortenburger, 2♂; NEVADA: Elko County: Spruce Mountain Road, 10.6 mi. E. Hwy. 93, 8600', 29 June 2014, R. L. Romeyn, 10♂ 1♀ (SK); UTAH: Box Elder County: Willard Peak, 17 July 1970, S. Kohler, 1♂ (SK); Cache County: Logan Canyon, 3 July 1980, S. Kohler, 28♂ (SK); Green Canyon, 1 July 1964, S. Kohler, 8♂ (SK); same locality, 11 July 1965, S. Kohler, 1♀ (SK); same locality, 2 July 1979, S. Kohler, 14♂ (SK); same locality, 14 July 1993, S. Kohler, 5♂ (SK); Green Canyon Rd., 3 mi. up, 1 July 2010, S. Kohler, 11♂ (SK); Green Canyon Rd., 4-5 mi. up, 2 July 2010, S. Kohler, 13♂ (SK); Hyde Park Canyon, 21 June 1965, S. Kohler, 1♀ (SK); WYOMING: Fremont County: vic. Dickinson Park Guard Station, 9300', Wind River Range, 26 July 2017, S. Kohler, 1♂ (SK); Lincoln County: Swift Creek, Afton, 2 July 1978, L. P. Grey, 2♂ (SK); Swift Cr., 2.5 mi. E. Afton, 7 July 1982, F. E. Holley, 1♂ (SK); Park County: Clarks Fork Overlook, Hwy. 212, 14 July 1982, S. Kohler, 1♂ (SK); Teton County: .5 mi. S. Togwotee Pass, 9660', 18 July 2005, S. Kohler, 1♂ (SK).

***Euphilotes ancilla barnesi*** Opler & M. Fisher, 2009  
(Figs. 147-150, 293-294)

*Euphilotes ancilla barnesi* Opler & M. Fisher, 2009, In Fisher, M. S. 2009, Butterflies Colo. 4: 126-128; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Colorado: Jefferson County; Indian Gulch, 1 mile west of Golden.

*Euphilotes a. barnesi* differs from *E. a. ancilla* by its darker grayish-white appearance below (Opler & Fisher, 2009). We consider *E. a. barnesi* to be endemic to Colorado's Front Range, where it is associated with *Eriogonum umbellatum* var. *umbellatum*. Records exist (from north to south) from Larimer, Boulder, Gilpin, Clear Creek, Jefferson, Douglas, Elbert and Park counties (Stanford & Opler, 1993; ADW pers. obs. 1990-2020). For now, populations further north, along the Colorado-Wyoming border in Larimer County, and on Colorado's west slope, which utilize *Eriogonum umbellatum* var. *majus* (= *Er. subalpinum*), are considered to represent *E. a. ancilla* (Fig. 387), although as noted above, these may be somewhat intermediate towards *E. a. barnesi*. Populations of *E. ancilla* to the northeast of *E. a. barnesi*, in prairie habitats utilizing *Er. flavum* as a larval food plant, are described as a separate subspecies, below.

***Euphilotes ancilla montosa* Kohler – new subspecies**  
(Figs. 151-170, 296, 353-361)

**ZooBank registration:** <urn:lsid:zoobank.org:act:0945169D-7192-487B-8A4A-118EA9FB68E2>

**Definition:** *E. a. montosa* differs from *E. a. ancilla* in the blue color of the male dorsal wings, which are a darker shade of blue in *E. a. montosa*, and the greater frequency of at least a partial dorsal hindwing orange aurora in the males of *E. a. montosa*. The underside wing surfaces of both sexes of *E. a. montosa* also have larger black macules, particularly on the hindwing, and more basal suffusion of dark scales on both the forewing and hindwing. The macules of the underside wing surfaces of *E. a. ancilla* are smaller and there is less dark basal suffusion. The usual larval food plant of *E. a. montosa* is *Eriogonum umbellatum*, although some populations at the higher elevations utilize *Eriogonum ovalifolium* var. *depressum* Blank. (Fig. 379, upper right and lower). *Eriogonum flavum* var. *piperi* (Greene) M. E. Jones is also utilized at some sites (Fig. 380, upper and lower), as detailed below.

**Etymology:** The Latin word “montosa” means mountainous, which is descriptive of the type of habitat where this subspecies is found.

**Distribution and Phenology:** This subspecies occurs in mountainous regions of western Montana, mainly west of the Continental Divide (Fig. 387). The adult flight period of the single brood extends through June and July, depending on elevation and seasonal development.

**Types:** Holotype male: **MONTANA: Missoula County:** Ninemile Prairie, Greenough, 14 June 1979, S. Kohler Coll. (46.95443, -113.54590). Allotype female: **MONTANA: Missoula County:** Ninemile Prairie, 16 June 2001, S. Kohler Collector. Paratypes: **MONTANA: Missoula County:** Ninemile Prairie, nr. Greenough, 18 June 1977, S. Kohler, 1♂ 4♀; same locality, 7 June 1979, S. Kohler, 2♂ 3♀; 9-Mile Prairie, 29 June 1978, S. Kohler, 15♂ 10♀; Ninemile Prairie, Greenough, 9 June 1979, S. Kohler, 16♂ 22♀; same locality, 11 June 1979, S. Kohler, 18♂ 14♀; same locality, 12 June 1979, S. Kohler, 21♂ 14♀; Ninemile Prairie, 25 May 1992, S. Kohler, 20♂ 13♀; same locality, 16 June 2001, S. Kohler, 1♂ 1♀; same locality, 26 June 2004, S. Kohler, 1♀; same locality, 20 June 2005, S. Kohler, 2♀; N. Ninemile Prairie, 3900', 8 June 2001, S. Kohler, 25♂ 21♀.

**Deposition of Types:** The holotype male, allotype female and four male and four female paratypes will be deposited in the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida. The remaining paratypes are in the Kohler Collection.

**Type Locality:** USA: MONTANA: Missoula County: Ninemile Prairie, northwest of Greenough.

**Additional Specimens Examined:** USA: **MONTANA:** **Beaverhead County:** Lacy Creek area, FR 73, south of Wise River, 25 June 2015, assoc. *Er. umbellatum*, S. Kohler, 2♂ (SK); May Creek area, 6340', Hwy. 43, west of Wisdom, 25 June 2015, assoc. *Er. umbellatum*, S. Kohler, 1♂ (SK); Gold Creek, 6600', FR 73, 15 mi. S. Wise River, 30 June 2017, assoc. *Er. umbellatum*, S. Kohler, 2♂ 1♀ (SK); **Broadwater County:** Avalanche Gulch, 16 July 2004, S. Kohler, 2♂ (SK); Avalanche Gulch, 4-8 mi. up, 30 June 2004, S. Kohler, 9♂ (SK); Avalanche Gulch, 6.5 mi. up, 8 July 2005, S. Kohler, 3♂ (SK); Avalanche Gulch, 6-8 mi. up, 12 June 2006, S. Kohler, 30♂ (SK); Avalanche Gulch, 8-9 mi. up, 20 June 2007, S. Kohler, 11♂ (SK); Avalanche Gulch, ca. mi. 4.0-4.8, 27 June 2007, A.D. Warren, 4♂ (at mud) (ADW); Avalanche Gulch, ca. mi. 7.8-8.1, 27 June 2007, A.D. Warren, 1♂ (at mud) (ADW); Avalanche Gulch, ca. mi. 9.0-10.0, 4 July 2007, A.D. Warren, 11♂ (at mud) (ADW); Confederate Gulch, 30 June 2004, S. Kohler, 4♂ 3♀ (SK); Confederate Gulch, 8.5 mi. up, 16 June 2004, S. Kohler, 2♂ (SK); **Carbon County:** nr. Red Lodge, 13 June 1978, S. Kohler, 1♂ (SK); East Rosebud Lake, 6200', 2 July 1989, B. Vogel, 1♂ 1♀ (SK); East Rosebud Lake, 6100', 30 June 1990, B. Vogel, 2♂ 3♀ (SK); ridge W. Cub Creek, 5-7 mi. SE of Belfry, 17 May 2007, S. Kohler 1♀ (SK); Hollenbeck Draw, 5 mi. SE of Belfry, 5 June 2007, S. Kohler, 3♀ (SK); Hell Roaring Plateau Rd., 22 July 2008, S. Kohler, 1♂ (SK); 2-3 mi. SW Belfry, 25 June 2008, S. Kohler, 1♂ 1♀ (SK); same locality, 19 June 2008, S. Kohler, 1♀ (SK); 2-3 mi. SW Belfry, 4125-4300', 11 June 2009, S. Kohler, 1♂ 1♀ (SK); 2-3 mi. SW Belfry, 4100-4325', 17 June 2009, S. Kohler, 6♂ (SK); 2-3 mi. SW Belfry, 4240-4350', 19 June 2009, S. Kohler, 3♂ 1♀ (SK); vic. MT-WY state line, Main Fork Rock Cr., 8100', SW of Red Lodge, 23 July 2019, S. Kohler, 7♂ (SK); same locality, 8 July 2020, S. Kohler, 1♂ (SK); **Deer Lodge County:** Forest Road 683, 2 mi. E. Silver Lake, 19 July 1993, S. Kohler, 4♂ (SK); same locality, 19 July 2004, S. Kohler, 1♂ (SK); E. Scott, (JAS Collection); **Teton County:** Pine Butte Ranch, 5100', 23 June 1998, R. E. Stanford (Lep. Soc. Seas. Sum.); Teton Canyon, W. of Choteau, 11 July 1989, J. Oberfoell, 1♂ (JO Collection).

### *Euphilotes ancilla campestris* Kohler – new subspecies (Figs. 171-196, 297-301, 362-365)

ZooBank registration: [urn:lsid:zoobank.org:act:C7CAAA9D-87F9-4AF2-9A7A-65413CEA8754](https://doi.org/10.1544/zoobank.urn:lsid:zoobank.org:act:C7CAAA9D-87F9-4AF2-9A7A-65413CEA8754)

**Definition:** *Euphilotes a. campestris* adult males are a lighter blue dorsally than those of *E. a. montosa*, and very rarely have even a hint of orange aurora on the hindwing. They have narrow black borders dorsally, especially on the hindwing, where often the border is reduced to a series of spots. The adult female orange aurora of *E. a. campestris* is narrower than that of *E. a. montosa*. The black macules on the underside wing surfaces of both sexes of *E. a. campestris* are smaller than those of *E. a. montosa*, and there is less basal suffusion of dark scales on both the forewing and hindwing. The male and female genitalia of *E. a. campestris* are typical for *E. ancilla*. The larval food plant is *Eriogonum flavum* var. *flavum* (Fig. 381, lower).

**Etymology:** The word *campestris* means “level, even or flat ground” or “on open plain” or “Plains-dwelling”, which is descriptive of the type of habitat where this subspecies is found.

**Distribution and Phenology:** *Euphilotes a. campestris* is widely distributed in the prairie regions of eastern Montana (Fig. 387), and is found near dry prairie hilltops and on low ridges with shallow soils that are thinly vegetated, such as the type locality (Fig. 381, upper). An evaluation of existing records for *Euphilotes ancilla* from the prairie regions of eastern Wyoming (and possibly far northeastern Colorado, e.g., Weld County, as indicated by Stanford & Opler (1993)), western North Dakota, South Dakota and Nebraska, as well as the southern portions of the Canadian provinces of Alberta and Saskatchewan, strongly suggests that those records all represent *E. a. campestris*. Though not recorded for North Dakota (Royer, 2003), a more recent record for that state exists; Square Butte, Golden Valley County, North Dakota, 12 June 2004, B. Reynolds and R. Royer. Marrone (2002) reported records for Lawrence and Fall River counties, South Dakota. His figures (p. 174) are consistent with the appearance of *E. a. campestris*. The specimens figured by Ferris & Brown (1981) on page 216 as *E. enoptes ancilla* from E. Laramie, Albany County, Wyoming, 28 June 1972, are consistent with the appearance of *E. a. campestris*. Hooper (1973) reported one specimen of *E. ancilla* taken near Elkwater in the Cypress Hills of Alberta, Canada, 18 June 1963, one specimen at Val Marie, Saskatchewan, Canada, 25 June 1968, and one from Rosefield, Saskatchewan, Canada, 26 June 1968. Layberry et al. (1998) map the above Canadian records and also additional localities for Alberta and Saskatchewan on page 155. They state that these records represent *E. a. ancilla*, but their discussion of the probable food plant as *Eriogonum flavum*, and the appearance of the adults (Plate 11, Figs. 42, 43) confirm that all of these Canadian records most probably also represent *Euphilotes a. campestris*. The period of adult flight of the single brood is mainly May and June.

**Types:** Holotype male: **MONTANA: Powder River Co.:** .8 mi. W. Pumpkin Cr. Rd. 24 mi. W. Broadus, S. Hwy., 13 June 2007, S. Kohler Collector (45.54154, -105.83300). Allotype female: **MONTANA: Powder River Co.:** .8 mi. W. Pumpkin Cr. Rd., 24 mi. W. Broadus, S. Hwy., 15 June 2007, S. Kohler Collector. Paratypes: same locality, 13 July 2007, S. Kohler Coll., 36♂ 16♀ (SK); same locality, 15 June 2007, S. Kohler, 8♂ 11♀ (SK); hills S. Hwy 212, 24 mi. W. Broadus, 26 June 2008, S. Kohler, 26♂ 18♀ (SK); hills S. of Hwy. 212, 3650', 22 mi. W. Broadus, 10 June 2015, S. Kohler, 7♂ 5♀ (SK). All assoc. *Er. flavum*.

**Deposition of Types:** The holotype male, allotype female and three male and three female paratypes will be deposited in the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida. The remaining paratypes are in the Kohler Collection.

**Type Locality:** USA: MONTANA: Powder River County: hills south of Highway 212, 0.8 miles west of Pumpkin Creek Road, 24 miles west of Broadus.

**Additional Specimens Examined:** USA: MONTANA: Cascade County: bluff 2.5 mi. N. Ft. Shaw, 3815', 8 June 2010, S. Kohler, 4♂ 4♀ (SK); 1 mi. NW Lowry Bridge, 5.5 mi. W. of Simms, 22 June 2009, S. Kohler, 1♂ 1♀ (SK); Carter County: FR 4035, Long Pines area, 36 mi. SE of Ekalaka, 14 June 2007, S. Kohler, 1♂ (SK); Hill County: badlands NW of Havre, 2550', 19 May 1998, G. CO state line, 27 June 1993, prob. assoc. *Er. flavum*, A.D. Warren, 1♀ (ADW).

**Additional Records:** Although not examined by us, the following records most likely represent this subspecies: USA: MONTANA: Fergus County: 10 mi. N. Big Snowy Mts., 22 June 1989, R. A. Royer (Lep. Soc. Seas. Sum.); Liberty

**County:** Corral Cr., East Butte, Sweet Grass Hills, 14 June 2005, 1♂; south rim of Marias River, 3100', N. of Ft. Benton, 19 June 1994, C. E. Harp (CEH Collection); **Toole County:** 3 mi. W. of Sunburst, 23 May 1987, N. G. Kondla, 1♂ (NGK Collection).

***Euphilotes ancilla* (W. Barnes & McDunnough, 1918) (SE Oregon segregate)**

Warren et al., 2016, Illustrated lists of American butterflies, Revised 21 Nov. 2017, Accessed 19 Feb., 2021. <http://www.butterfliesofamerica.com>.

Warren (2005) discussed populations of *Euphilotes ancilla* in northern Harney County, Oregon, found in association with *Eriogonum sphaerocephalum* var. *sphaerocephalum*. He stated that the adults are unique among members of the *E. enoptes* complex in Oregon, in that ventral wing spots are large and bold, and females have prominent, very well-developed hind wing aurorae. Before 2003, this segregate of *E. ancilla* was known from just a few specimens, all from Harney County. In 2003, Warren located large populations of *E. ancilla* in the Hines-Burns area. Hundreds of individuals were observed among dense stands of *Er. sphaerocephalum* var. *sphaerocephalum*. *Eriogonum strictum* was also present at the site in Burns, but was ignored by *Euphilotes* adults.

In addition to the population of this segregate in the Burns-Hines area, Richard Romeyn (pers. comm., 2021) has recently documented the occurrence of both *Er. sphaerocephalum* var. *sphaerocephalum* and the associated *E. ancilla* at multiple sites along the Highway 395 corridor south into Modoc County, California (not mapped on Fig. 387). He noted that adults at all sites sampled in the Warner Mountains, east of Alturas, California, were indistinguishable in phenotype from those flying at Burns-Hines, Oregon. Thus, the overall distribution of this segregate (Fig. 387) may well be far greater than originally thought. The use of the species name *Euphilotes ancilla* for these populations is tentative, however, as they may be more closely related to *E. columbiae*. Further details and a formal description of these populations will be provided by the authors in a subsequent publication.

***Euphilotes ancilla giulianii* Pratt & J. Emmel, 1998**

*Euphilotes ancilla giulianii* Pratt & J. Emmel, 1998, Syst. W. N. Am. Butterflies (16): 214-215; Pelham, 2008, J. Res. Lepid. 40: 250; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Nevada: Nye County; Grapevine Mountains, ridge 0.8km southeast of Wahguyhe Peak, 2300-2400m.

Pratt & Emmel (1998) stated that this subspecies is the most distinct of the *E. ancilla* group, looking superficially much like *E. baueri*. It is different from other *Eriogonum umbellatum*-feeding populations in the increased amount of blue in females, the narrow width of the black border in males, and its small size. The larval food plant is *Eriogonum umbellatum* var. *versicolor* S. Stokes. The range of *E. a. giulianii* is limited to the Grapevine Mountains and Last Chance Range of southeastern California and southwestern Nevada (Fig. 387).

***Euphilotes ancilla gilvatunica* Austin, 1998**  
(Fig. 302)

*Euphilotes ancilla gilvatunica* Austin, 1998, Syst. W. N. Am. Butterflies (45): 553-554; Pelham, 2008, J. Res. Lepid. 40: 251; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Nevada:, Washoe County; Nevada State Route 341, 3.3 road miles east of US 395, 1525m, T18N R20E S5 on USGS Steamboat, Nev. 15' quadrangle.

Austin (1998) stated that *E. a. gilvatunica* differs from other *E. ancilla* taxa in its relatively large size, the black of the outer margins of males tending to be of individual spots in each cell (especially on the hindwing), its dark brown females, and its yellowish tinged ventral surface with relatively large macules. Males also have less submarginal orange on the dorsal hindwing than is usual among *E. a. ancilla*. This subspecies occurs in western Nevada from about the Reno, Washoe County area south into Mineral County and east into the mountains of central Nevada (Fig. 387). The single brood has been recorded from late May through early August (mostly in June). No food plant association was provided in the original description, but *E. a. gilvatunica* reportedly uses *Eriogonum umbellatum* var. *umbellatum* (Shields, 1977) and *Eriogonum lobbii* Torr. & Gray (Austin, pers. comm., 2003).

***Euphilotes ancilla shieldsi* Austin, 1998**

*Euphilotes ancilla shieldsi* Austin, 1998, Syst. W. N. Am. Butterflies (45): 553; Pelham, 2008, J. Res. Lepid. 40: 251; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Nevada: Esmeralda County; White Mountains, Trail Canyon Road, 9.5 road miles west of Nevada state route 264, 2286m, T1S R34E S6 on USGS Davis Mountain, Nev.-Calif. 15' quadrangle.

Austin (1998) stated that *E. a. shieldsi* is most similar to *E. a. purpura* (see below), but is not as deeply colored, has narrower black margins and white wing fringes. The gray flush of the ventral forewing is not as extensive, and the macules of the submargin tend to be separate rather than fused, as on *E. a. purpura*. *Euphilotes a. shieldsi* differs from *E. a. ancilla* in its deeper purplish (less blue) color, broader black margins and larger ventral macules. This subspecies is known only from the White Mountains, Esmeralda County, Nevada, and the Quinn Canyon Range, Nye County, Nevada (Fig. 387). The known flight period extends from mid-June to late July. The larval food plant is *Eriogonum umbellatum*.

***Euphilotes ancilla purpura* Austin, 1998**  
(Figs. 197-198)

*Euphilotes ancilla purpura* Austin 1998, Syst. W. N. Am. Butterflies (45): 552; Pelham, 2008, J. Res. Lepid. 40: 251; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Nevada: Clark County; Spring Mountains, Willow Creek, 1829m, T18S R55E S2 on USGS Mt. Stirling quadrangle, 15' series.

Austin (1998) stated that males of *E. a. purpura* are readily recognizable from those of all other *Euphilotes* by their deep purple-blue color, very broad black margins, the black forewing fringe, and the strong gray flush on the ventral forewing. He noted the distribution of this subspecies as middle elevations of the Spring Mountains of Clark County and the road to Mt. Stirling in southern Nye County, Nevada (Fig. 387). Austin (1998) also stated that *E. a. purpura* is found locally near colonies of its probable larval food plant, *Eriogonum umbellatum* var. *subaridum* S. Stokes, and that the single brood flies from late May to mid-August. This information was discussed, clarified, and corrected in Austin et al. (2008), where the authors documented the existence of two cohorts of *E. ancilla* feeding on two different taxa of *Eriogonum* in the Spring Mountains. They determined that the early season cohort flying in May and June and utilizing *Eriogonum umbellatum* var. *juniporinum* Reveal is *E. a. purpura*, and that the late season cohort flying in July-August and utilizing *Er. umbellatum* var. *subaridum* is *E. a. cryptica* (see below).

***Euphilotes ancilla cryptica* Austin & Boyd, 2008**  
(Figs. 199-200)

*Euphilotes ancilla cryptica* Austin & Boyd, 2008, In Austin et al., J. Lepid. Soc. 62(3): 157-158; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Nevada: Clark County; Spring Mountains, Cold Creek, 1825m in elevation, towards the northern end of these mountains.

As discussed above, *E. a. cryptica* was described (Austin et al., 2008) as the late season cohort of *E. ancilla* in the Spring Mountains of Nevada, with larvae feeding on *Eriogonum umbellatum* var. *subaridum*. Austin et al. (2008) stated that *E. a. cryptica* is distinguished from *E. a. purpura* by several biological traits, including larval food plants, flight season and diapause intensity. They also stated that size, wing pattern and genital morphology of *E. a. cryptica* are apparently identical with *E. a. purpura*. This taxon is known from several sites on both slopes of the Spring Mountains in Nye and Clark counties, Nevada (Fig. 387).

***Euphilotes ancilla pseudointermedia* Pratt & J. Emmel, 1998**

*Euphilotes ancilla pseudointermedia* Pratt & J. Emmel, 1998, Syst. W. N. Am. Butterflies (16): 214; Pelham, 2008, J. Res. Lepid. 40: 251; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** California: Nevada County; Castle Peak near Donner Pass, 2700m.

Pratt & Emmel (1998) stated that this subspecies is probably closely related to *E. a. ancilla*. *Euphilotes a. pseudointermedia* is associated with *Eriogonum umbellatum* and its resemblance to *E. glaucon intermedia* is remarkable. Pratt & Emmel (1998) stated that the two cannot be distinguished by wing morphology. Males of *E. a. pseudointermedia* have a broad black border above and both sexes have a narrow orange aurora on the dorsal hindwing. The distribution of *E. a. pseudointermedia* includes the alpine region of the Sierra Nevada Mountains in Nevada and Mono counties, California (Fig. 387).

## THE EUPHILOTES RITA COMPLEX

Pelham (2021) included the following species in the *Euphilotes rita* complex: *E. spaldingi* (W. Barnes & McDunnough) (Figs. 310, 370), *E. rita* (W. Barnes & McDunnough) (Figs. 311-314, 371-374) and *E. pallescens* (Tilden & Downey) (Figs. 315, 375). In this species complex, the valvae of the male genitalia have christae, and the valva is noticeably narrowed laterally in the mid-portion and widened distally to become paddle-shaped, with long bristle-like terminal teeth (Fig. 311). The falces are very short, compared to the *E. batoides* and *E. enoptes* species complexes. In the female genitalia, the lodix (genital plate) is much reduced and is elongated, narrow, and tube-shaped in *E. rita* and *E. pallescens* (Figs. 371, 375), but more shortened and somewhat broader in *E. spaldingi* (Fig. 370).

***Euphilotes rita rita* (W. Barnes & McDunnough, 1916)**  
(Figs. 201-202)

*Lycaena rita* W. Barnes & McDunnough, 1916, Can. Entomol. 48(7): 223-224.

*Philotes rita* B. & McD., 1916; W. Barnes & McDunnough, 1916, Contrib. Nat. Hist. Lepid. N. Am. 3(2): Plate XI, Fig. 3; McDunnough, 1938, Mem. S. Calif. Acad. Sci. 1: 28.

*Philotes rita rita* (Barnes & McDunnough), 1916; dos Passos, 1964, Mem. Lepid. Soc. (1): 67; Langston, 1969, J. Lepid. Soc. 23(1): 52.

*Shijimaeoides rita rita* (Barnes & McDunnough), 1916; Shields, 1975, Bull. Allyn Mus. (28): 16; Shields, 1977, J. Res. Lepid. 16(3): 164.

*Euphilotes rita rita* (Barnes and McDunnough); Miller & Brown, 1981, Mem. Lepid. Soc. (2): 119.

*Euphilotes rita rita* (W. Barnes & McDunnough, 1916); Pelham, 2008, J. Res. Lepid. 40: 251; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Arizona: Cochise County; Huachuca Mountains, near Ramsey Canyon.

*Euphilotes r. rita* occurs from extreme southern Utah (although these may be closer to the Four Corners Area segregate discussed below), south through central Arizona, then east through southern New Mexico into western Texas (Fig. 388) (Stanford & Opler, 1993). Females have bright, broad aurorae on the dorsal hindwings, and both sexes have bold aurorae on the ventral hindwings. Males often have a poorly-developed aurora on the dorsal hindwing, as well. The larval food plant for *E. r. rita* was cited as “close to *Eriogonum wrightii*” by Mattoni [1966] and Langston (1969), and was confirmed as *Er. wrightii* Torr. Ex Benth. by Bailowitz & Brock (1991). Shields (1977) and Bailowitz & Brock (1991) described the flight period of *E. r. rita* as mid-August to late September.

***Euphilotes rita coloradensis* (Mattoni, [1966])**  
(Figs. 203-206, 311, 371)

*Philotes rita coloradensis* Mattoni, 1966, J. Res. Lepid. 4(2): 88-92; Langston, 1969, J. Lepid. Soc. 23(1): 52.

*Shijimiaeoides rita coloradensis* (Mattoni); Shields, 1977, J. Res. Lepid. 16(3): 164.

*Euphilotes rita coloradensis* (Mattoni); Miller & Brown, 1981, Mem. Lepid. Soc. (2): 119.

*Euphilotes rita coloradensis* (Mattoni, [1966]); Pelham, 2008, J. Res. Lepid. 40: 251; Pelham, 2021, <http://www.butterfliesofamerica.com/US-Can-Cat.htm>.

**Type Locality:** Colorado: Lincoln County; 7 miles south of Kendrick.

Mattoni [1966] noted that in general, *E. r. coloradensis* is similar to *E. r. rita*, but that *E. r. coloradensis* may be distinguished by the male having a purplish-blue overlay and wider terminal line (dark wing margins) dorsally. In both sexes, the darker greyish underside ground color and clear halos are diagnostic of *E. r. coloradensis*. Otherwise, the females were thought to be indistinguishable. Mattoni [1966] noted the larval food plant as *Eriogonum effusum*. Shields (1977) also reported *Er. effusum* var. *effusum* as a food plant for *E. rita coloradensis*, and stated that it and *E. r. rita* are distinguishable, but closely related subspecies that intergrade in north-central New Mexico. Cary (2021) recognized both *E. r. rita* and *E. r. coloradensis* as occurring in New Mexico; the former utilizing *Er. wrightii* in the southern part of the state, and the latter utilizing *Er. effusum* var. *effusum* and *Er. rotundifolium* Benth. in central and northeastern New Mexico.

At most locales, the single generation of *E. r. coloradensis* flies in mid-July through August. The currently understood distribution of *E. r. coloradensis* includes south-central and southeastern Wyoming, far southwestern Nebraska (e.g., Dundy Co., see Stanford & Opler, 1993), eastern Colorado (also far NW Colorado in Moffat Co.), and northern and central New Mexico (Fig. 388). However, subtle patterns of geographic variation have been detected within this region; e.g., females from the southern San Luis Valley in Colorado (Costilla Co.) have reduced aurorae on the hindwings. A review of Colorado populations of *E. rita*, in conjunction with study of populations discussed below, will be completed in a subsequent publication by the authors.

***Euphilotes rita* (W. Barnes & McDunnough, 1916) (Four Corners Area segregate)**

Warren et al., 2016, Illustrated lists of American butterflies, Revised 21 Nov. 2017, Accessed 19 Feb., 2021, <http://www.butterfliesofamerica.com>.

Adults in populations of *E. rita* examined from far northwestern New Mexico, near Aztec, and adjacent parts of northeastern Arizona and southern Utah (Fig. 388) differ from those of *E. r. rita* or *E. r. coloradensis* in having generally narrower dorsal (on females) and ventral aurorae, as shown by Warren et al. (2016), and females are paler above compared to those of *E. r. rita* and *E. r. coloradensis*, with a generally faded appearance approaching that seen in females of *E. pallescens emmeli* (Shields). Adults fly in August. These populations are associated with *Eriogonum leptocladon* Torr. & A. Gray. Further study of these populations is required to determine if they are unique at the subspecies-level.

***Euphilotes rita montanensis* Kohler – new subspecies**  
(Figs. 207-234, 312-314, 372-374)

ZooBank registration: <urn:lsid:zoobank.org:act:BF83A4D8-77AC-4C27-B438-08B5584B2CD2>

Werner et al. (2004), in *Amphibians and Reptiles of Montana*, divided the state into five ecological provinces, two in the prairie regions and three in the western mountains (Fig. 389). Ecological provinces are based on geographical features, such as mountains and plains, and on large plant communities, such as grasslands and forests. The Great Plains Dry Grassland Province is the largest of these five provinces. It includes everything east of the Rocky Mountains except for several island mountain ranges and the small portion of arid land comprising the Intermountain Semi-desert Province. This latter province is the small northward extension of a large arid region of Wyoming, the Bighorn Basin, and lies in the rain shadow of the Beartooth Mountains. This dry desert habitat near Belfry, Montana (Fig. 382, upper), has been fascinating to study and explore, as it is home to several species of butterflies of more arid, southerly distributions, including such species as *Cercyonis meadii* (W. H. Edwards), *C. stenele* (Boisduval), *Chlosyne acastus* (W. H. Edwards), *Euphydryas anicia wecoeut* M. Fisher, Spomer & Scott, and the more recent discovery of *Hesperopsis alpheus* (W.H. Edwards). It was here that populations of *Euphilotes rita* were first discovered in 2007.

**Definition:** The dorsal wing color of male *E. r. montanensis* is similar to that of *E. r. coloradensis* but not quite as purplish, more intermediate in shade between *E. r. rita* and *E. r. coloradensis*. The black wing borders of *E. r. montanensis* are also not quite as wide as in *E. r. coloradensis*, but wider than in *E. r. rita*. The dorsal hindwing orange aurora of female *E. r. montanensis* is narrower than in *E. r. coloradensis*. The ground color of the underside wing surfaces of both sexes of *E. r. montanensis* is not as dark of gray as in *E. r. coloradensis*, but a shade darker than *E. r. rita*. The series of secondary submarginal macules on the ventral forewing of *E. r. coloradensis* is usually heavy and the spots more rounded, while this series of macules in *E. r. montanensis* is faint and the spots not rounded but more crescent-shaped, like *E. r. rita*. The shape of the valva of the male genitalia of *E. r. montanensis* also differs from both *E. r. rita* and *E. r. coloradensis*. In these two subspecies the anal angle of the ventral portion of the cucullus of the valva forms a fairly sharp right angle with small indentations along the terminal margin (Fig. 311). In *E. r. montanensis*, the anal angle has a more curved radius and the terminal margin is more entire, without the small indentations (Figs. 312-314). The adults of *E. r. montanensis* are closely associated with *Eriogonum pauciflorum* Pursh, the presumed larval food plant (Fig. 382, lower).

**Etymology:** The word *montanensis* means “from Montana”, and denotes the primary distribution of this subspecies. It is consistent with the nearest named subspecies, *E. r. coloradensis*.

**Distribution and Phenology:** Thus far, *E. r. montanensis* has been found only in a few localities near Belfry in Carbon County, Montana, and at an adjacent area in northern Park County, Wyoming (Fig. 388). The single brood flies from late May through June. *Euphilotes r. montanensis* is remarkable for having a

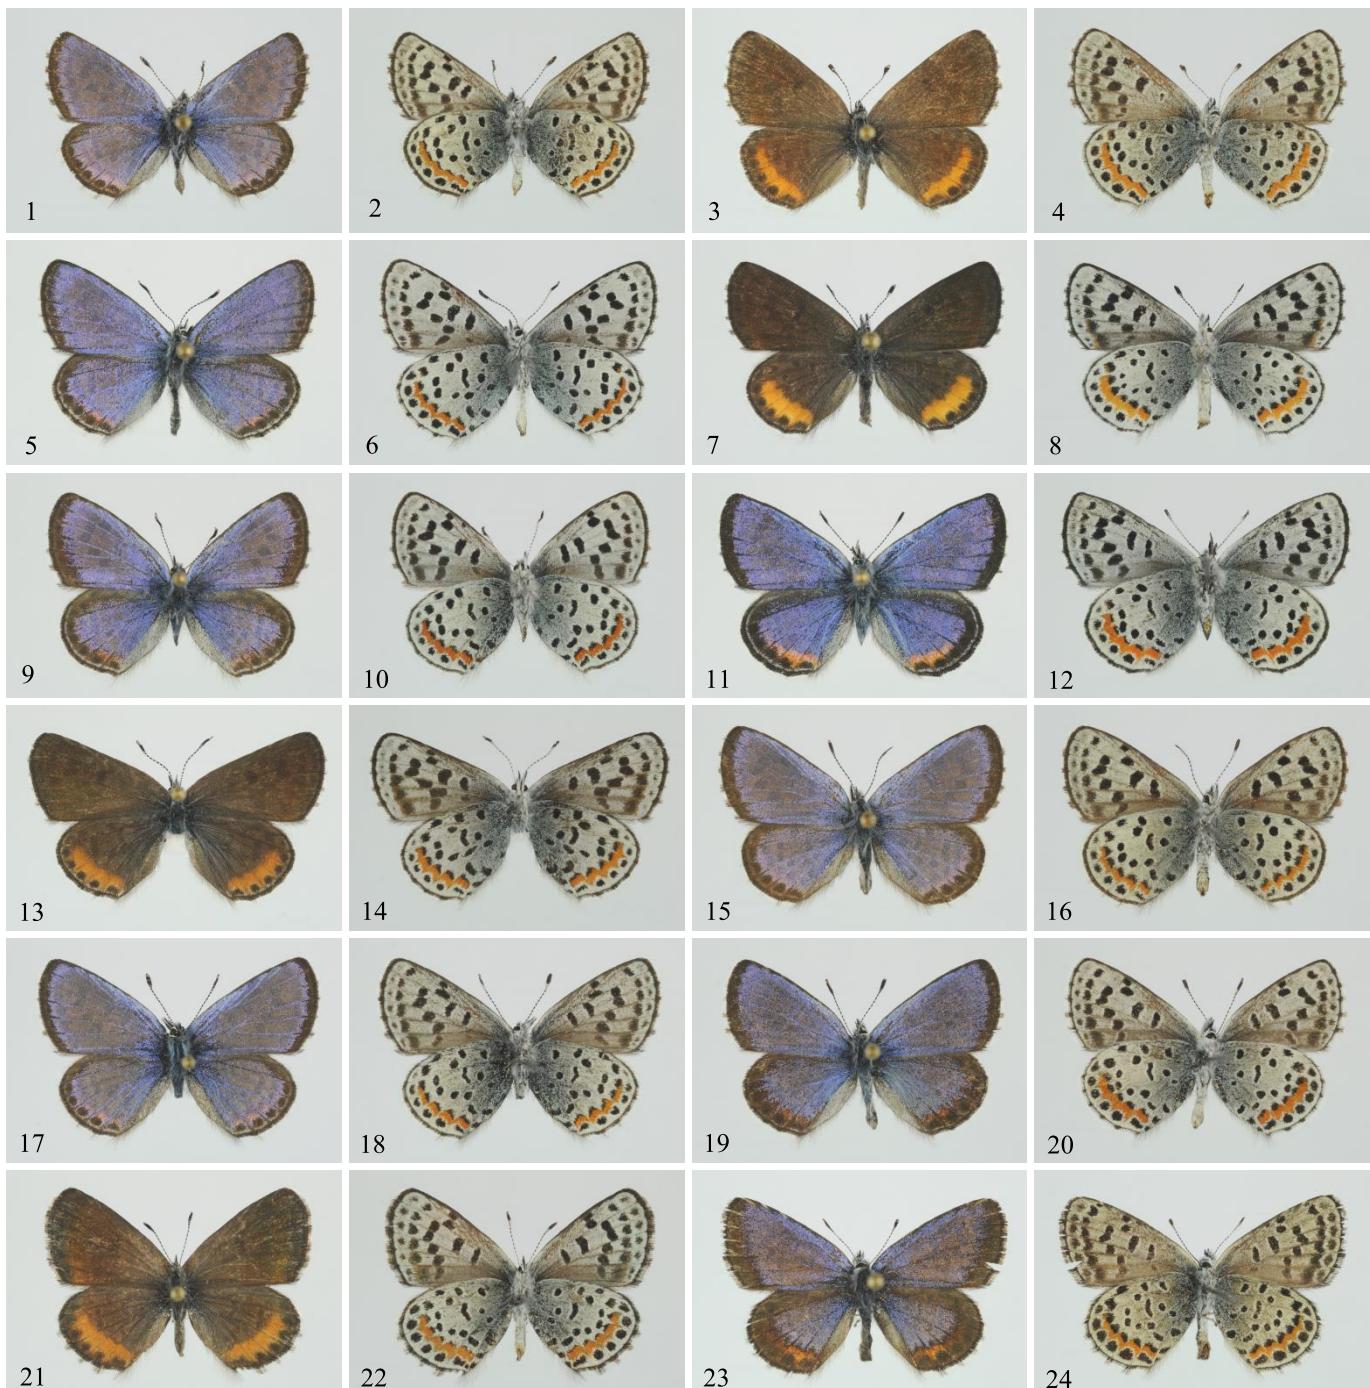

May-June period of adult flight as opposed to August-September for *E. r. rita* and July-August for *E. r. coloradensis*. Also remarkable is the food plant association of *Eriogonum pauciflorum*.

**Types:** Holotype male: **MONTANA: Carbon Co.**: Hollenbeck Draw, 5 mi. SE of Belfry, 23 May 2007, S. Kohler Collector (45.00569, -109.04955). Allotype female: **MONTANA: Carbon Co.**: Hollenbeck Draw, 5 mi SE of Belfry, 5 June 2007, S. Kohler Collector. Paratypes: **MONTANA: Carbon County**: Hollenbeck Draw, 5 mi. SE of Belfry, 5 June 2007, S. Kohler, 1♂ (SK); same locality, 23 May 2007, S. Kohler, 1♂ (SK); same locality, 9 June 2010, S. Kohler, 1♂ (SK); same locality, 22 June 2011, S. Kohler, 54♂ 23♀ (SK); same locality, 9 June 2015, S. Kohler, 4♂ 1♀ (SK); Hollenbeck Draw, 4125-4200', 5 mi. SE Belfry, 11 June 2009, S. Kohler, 4♂ 1♀ (SK); Hollenbeck Draw, 4050-4250', 5 mi. SE Belfry, 12 June 2009, S. Kohler, 1♂ 2♀ (SK); same locality, 16 June 2009, S. Kohler, 8♂ 2♀ (SK); Hollenbeck Draw, 4000-4320', 5 mi. SE Belfry, 19 June 2009, S. Kohler, 3♂ 4♀ (SK); same locality, 8 June 2015, S. Kohler, 3♂ 2♀ (SK).

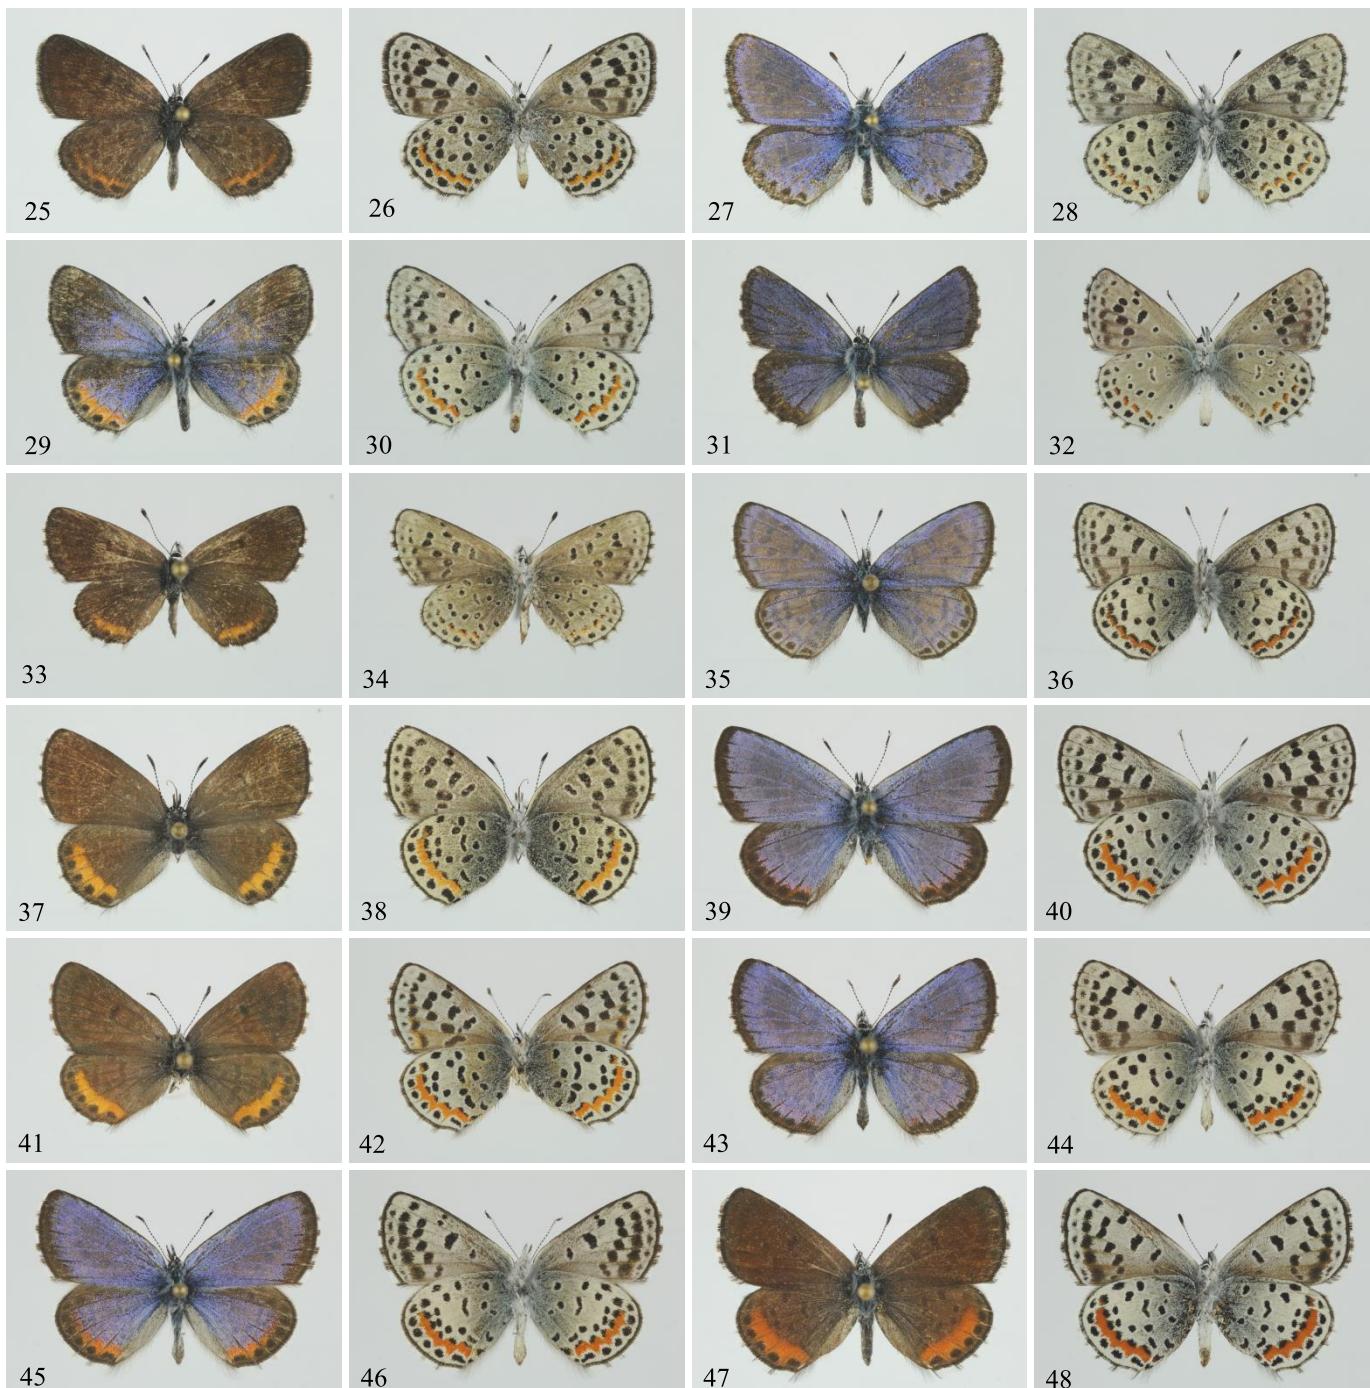

**Deposition of Types:** The holotype male, allotype female, and three male and three female paratypes will be deposited in the McGuire Center for Lepidoptera and Biodiversity, Florida Museum of Natural History, University of Florida, Gainesville, Florida. The remaining paratypes are in the Kohler collection.

**Type Locality:** USA: Montana: Carbon County: Hollenbeck Draw, 4200', 5 miles southeast of Belfry.

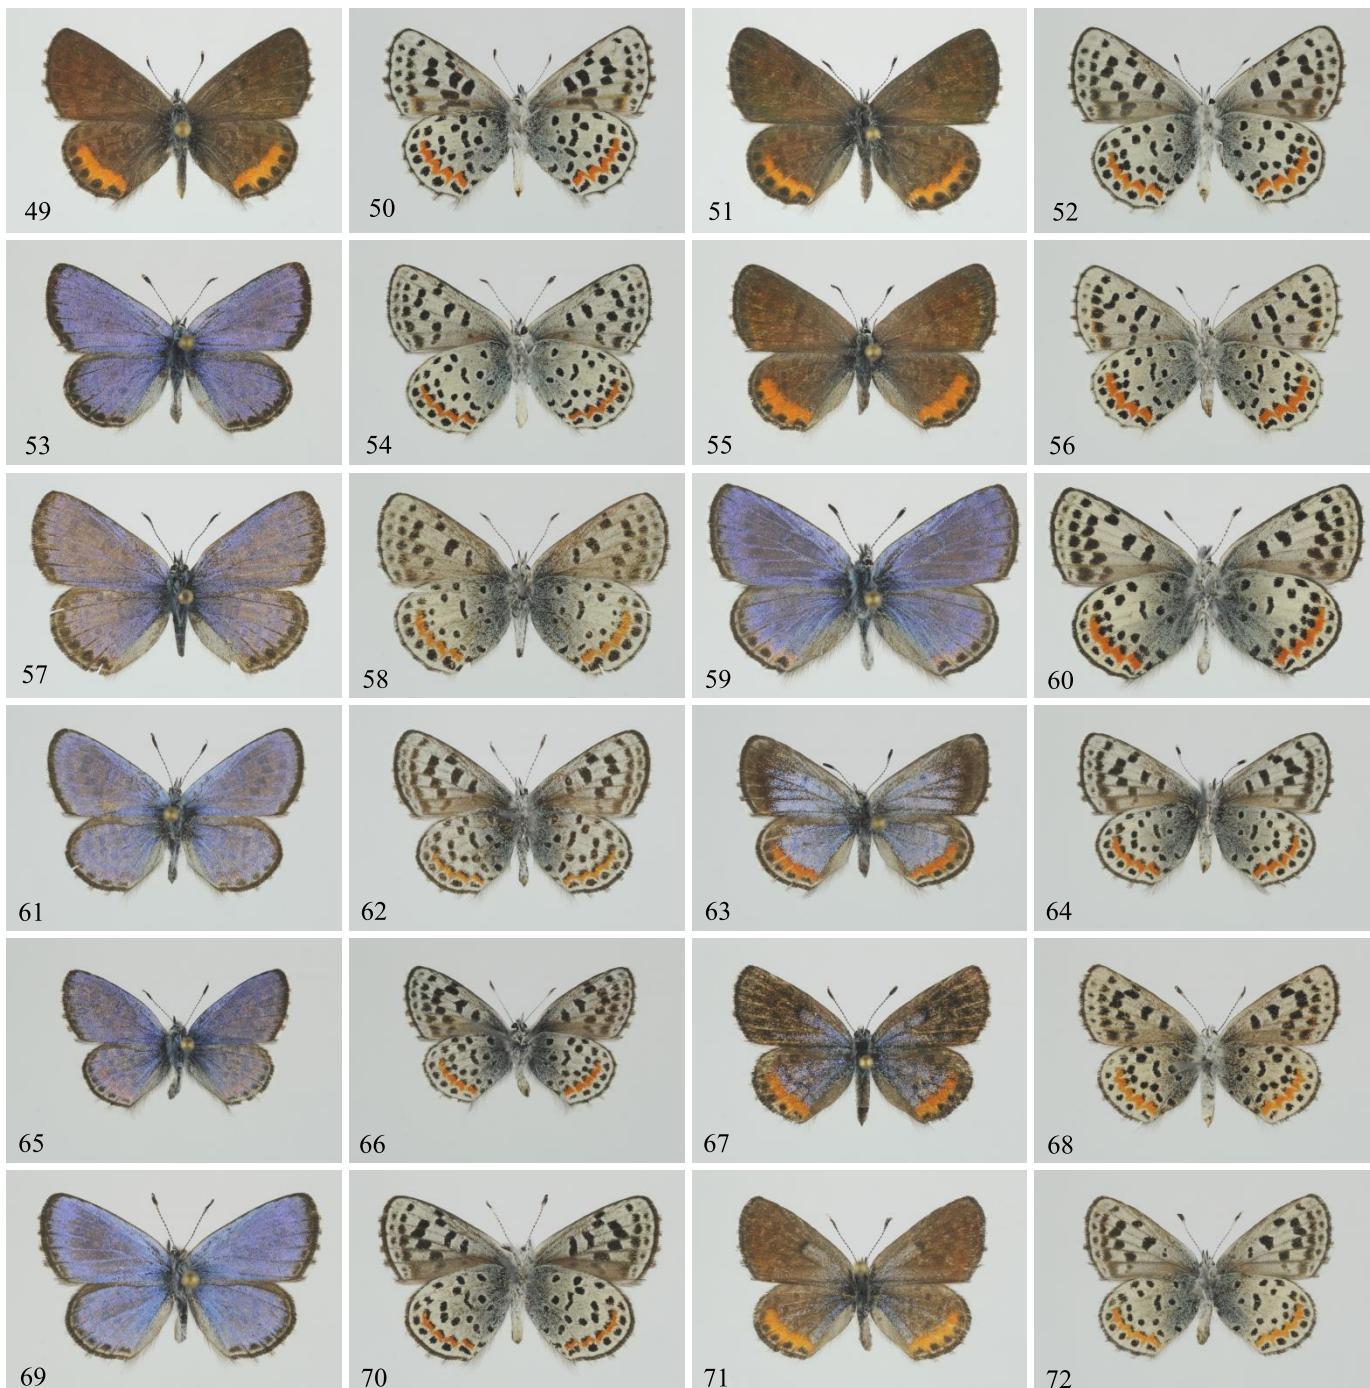

**Additional Specimens Examined:** USA: **MONTANA: Carbon County**: 2-3 mi. SW Belfry, 19 June 2008, S. Kohler, 1♂ 1♀ (SK); same locality, 25 June 2008, S. #### ACKNOWLEDGMENTS

Appreciation is given to Jonathan P. Pelham and Richard L. Romeyn for their encouragement and review of this paper and for providing specimens and distribution records. Peter Lesica has identified many *Eriogonum* host plants over the years, and also reviewed this paper. Many people have provided specimens, collection records, information and other assistance. They include, among others: T. Aneiros, George T. Austin, B. Boyd, Barton B. Brinkman, John Christenson, Vernon Covlin, Chris Durden, John F. Emmel, David Ewer, Nancy Ewer, Clifford D. Ferris, Michael S. Fisher, G. A. Gorlick, Lionel P. Grey, Megan Hansen, Chuck E. Harp, Frank E. Holley, J. Johnson, Kim Kendall, Will Kerling, Norbert G. Kondla, John Lane, Gary Lawson, Glen Marangelo, David Nunnallee, Jo Nunnallee, James Oberfoell, B. A. O'Hara, Paul A. Opler, Tom W. Ortenburger, W. D. Patterson, Adam Peters, Jeffrey S. Pippen, Gordon F. Pratt, Floyd Preston, June Preston, Robert M. Pyle, Dana Ross, Ronald A. Royer, James A. Scott, L. M. Scott, Charles Slater, Ray E. Stanford, Terry Stoddard, Kenneth Tidwell, Dave Trochlell, John B. Vernon, Bea Vogel, Byron Weber and Jacque Wolfe.

**The Taxonomic Report**  
is a publication of  
**The International Lepidoptera Survey (TILS)**

The International Lepidoptera Survey is registered as a non-profit Limited Liability Company (LLC) in the state of Virginia, U.S.A. The Taxonomic Report (TTR) is published for the purpose of providing a public and permanent scientific record. Contents are peer-reviewed but not necessarily through the anonymous review and comment process preferred by some publishers of serial literature. It appears in digital, open-access form, is regularly disseminated in hardcopy form to select institutional repositories and is also available as printed copy upon request at the discretion of authors and/or the editor. Printing and postage costs may apply. An initial run of 25 copies is printed on paper to meet ICZN recommendation 8B. Copies of all TTR papers are available at the archival TTR website: (<http://lepsurvey.carolinanature.com/report.html>) and via the following digital repositories:

Internet Archive (<https://archive.org/>)

Biodiversity Heritage Library (<https://www.biodiversitylibrary.org>)

Zobodat (<https://www.zobodat.at/>)

**TILS Purpose**

TILS is devoted to the worldwide collection of Lepidoptera for the purpose of scientific discovery, determination, and documentation, without which there can be no preservation.

**TILS Motto**

“As a world community, we cannot protect that which we do not know”

**Articles for publication are sought**

They may deal with any area of research on Lepidoptera, including faunal surveys, conservation topics, methods, etc. Taxonomic papers are especially welcome. There are no page charges for authors. Before sending a manuscript, simply write to **TTR editor, Harry Pavulaan, 606 Hunton Place NE, Leesburg, VA, 20176, USA** to initiate discussion on how to best handle your material for publication, and to discuss peer review options; or email to [intlepsurvey@gmail.com](mailto:intlepsurvey@gmail.com) (cc: to [harrypav@hotmail.com](mailto:harrypav@hotmail.com) if you do not receive a reply within one week).
